1. New Yahoo reflector

Yahoo group: Clansman351
Date: 2011-05-25 22:13:06 UTC
From: belton_alan
Topic: 1 Message: 1

Hi,
I saw I'd been "joined" on this reflector, so thought I'd better post something to see who else is about!

Overall, not such a bad idea to have a separate group for each major radio, (or at least related radios, like the 351/2 and possibly 350, which has many very similar characteristics.

Back home in the UK (where I'm hopefully heading in slightly over a week now) I have a pair of 352's with the 20W amp and SURF (so it can run 20W into a whip on the SURF antenna socket)and a pair of 350's with the little SURF unit on the side. All of the radios are very, well battered, but work really well, especially the rx side of things.

I've also got the monster 351/2 and 350 test jigs, where the case can be stripped off, and the motherboards mounted on an open test-bed, with sprung-loaded contacts: stuff is so cheap currently that I have'nt used it other than once, but after Clansman supplies dry up, it'll be handy to be able to fault-find the radio's properly.

Stewart,
Thanks for your creativity! Good point to keep stuff separate, as it works well enough with other specialized groups, like the 319 reflector. If you lurk on most of the associated groups, you can probably invite more people along, who post about 351 related stuff.

Test gear: yes, back home I've got the generic sort of Racal stuff like signal generators, rf/af power meters, counters, mod meter, and an aging Marconi 110MHz spectrum analyzer, as well as the test rigs, so can check out most Clansman stuff down to either module or component level. Currently hardly worth the time, but sooner or later it'll become more useful. It's particularly handy that there are now virtually all the EMERS available for the 351/2 as well, so you can see what you're doing., rather than "tweak and hope"

With the 351, I've encountered very few actual component failures, only a few oddities in the tx/rx switching, and a couple of leaky tubular tantalum capacitors. No HT failures in the varicap supply, and no PA failures in the 351 or 352. (Despite having one of them cranked up to 30W, into the flexible battle-whip).

Currently getting interested in the Racal TDED/MEROD, which although was mostly used with the 320 and 319, was used with the VHF Clansman kit very successfully, at 150 baud or more on good paths.

I'm currently after a schematic of the modifications used to generate the 351M suffix set used by mostly Marines with BID boxes, ie, where the external modulation is fed in, and taken off from. The frequency response on tx and rx has been decribed, but not the actual points used to achieve this.

Topic: 1 Message: 5

Mike,
Good to work you via this means: I got one of the (huge) 351/2/350 test rigs for the case, with the contents chucked in at a boot sale, for GBP10 or so, I think, and the other new one for about GBP20, collected, as it was too big to go by ParcelFarce.
All my kit now shipped, so no longer QRV, other than the 2m HT in my hurricane pack. Will have to be 20m, once back home and sorted out: that should work, i'd reckon, as I've worked the SE of the USA previously from the home location. If not, there's always JT65, although not the best for long chats (or any chats)

Hi Alan, yes, me too! I was joined by someone! Not had any mails yet though - have you? I am setting up a D4 dipole here (Cushcraft) and trying it out vs the wire antenna. I am trying it 90 degrees off the wire one, to see what EU comes in like.

I too have a couple of 352's GSA and ele kits, plus the test jigs. All here in Houston. There are some silly prices like $500.00 quid for a shiny one, but some good cheap ones, too.

I re-bro 2 or 70cms boxes down to 6m for fun. I just bought a diamond 5/8 over 5/8 (21ft long) and about 5db gain apparently. Will try to get it up this weekend, with it being a bank holiday and all.

I can easily hit Florida from here, so if you want to try a sked at the weekend, let me know!

Off to swing the dipole around a bit more...

Best regards,

Mike Berriman.

6. 351/352case bits

Yahoo group: Clansman351
Date: 2011-05-26 06:25:48 UTC
From: Michael Buckley
Topic: 1 Message: 6

Hi all

(or both is it?)

I have some scrap cases for both the set and the amp
Little or nothing inside

They are going for scrap unless somebody wants any bits to replace a
broken component.

The back plate of the amp in particular gets broken and these are OK.

Cheers

Mike

I think there's enough of us to form a square now, so it's improving.

The back plate and lugs broke off on the early AM-352 backplates if you stood on the radio, on its GS frame, or if it had made a parachute descent whilst still on the GS frame. (Probably less likely in civvy usage).

Later ones had a backplate made from similar thickness aluminum alloy plate, as opposed to diecast alloy, so would bend rather then break off.

Slightly off topic, but a small Micheal Caine type "Not a lot of people know that" factoid: I recall seeing a very strange lashed up, but working Clansman backpack, with a 4Ah battery, hand-crank gennie, two 20 W amps on top of each other, a SURF, and a battle whip, hooked into a 349 with a BNC test adaptor on it.
This was Sea Cadets, out on Dartmoor, and the story behind it was that they had been given a large pile of kit, including 349's, and most of the CES for 351/2's, but no actual 351's. Their resourceful signals bloke (allegedly a radio ham) bought some of the BNC adaptors off of eBay and took it from there: they pinged the needle well over on the SURF, so were probably about 20W output.

It actually looked a bit like a 319, with all the bricks and cables, so I suggested they tried putting it on ebay as " PRC-348 SAS Ninja Spy radio" or similar, as virtually everyone else does.

Hello all,
I'd like to say hello and thanks for allowing me to join this new group. I've developed an interest in HAm Radio lately and currently own a Kenwood TS-50 I pulled from a sailboat I bought awhile ago. I'm working on my Tech license and hope to have it soon. I served in the US Army for 22 years and am retired and wanted to do some green radio collecting and use something similar to what I used in the Army, A PRC-77 but they are hard to find, too old and prices are expensive. I found out about the PRC-351 has the same freq range and and is newer tech and the prices are just right. I just bought a PRC kit (RT351, 1.1Ah Battery NC, Headset & pressel, 0.6m Flexable Antenna, and carrying frame GS) from a guy selling them in dereham Norfork, UK and his prices are low at 40GBP. Looking forward to adding extra upgrades like a longer whip and 20 amp to boost the power. Pictures will be posted when it arrives. I just I receive good equipment when it arrives.

Thanks,

Jim

Hi Jim
I know this guy in Norfolk. I have bought from him too.
The battle whip works pretty well. The four section antenna I have found does not really work much better. There is an amplifier available that gives 20watts out. This is then a PRC352. The 351 is good for us here on the six metre band and we have four metres too so its quite a useful radio.
Cheers

You can get a charger that runs from 12Volts. Watch the price as some of the ebay guys are expensive. Do a search for Clansman DCCU. Make sure it is the 14 volt version NOT the 28 volt version. They don't come with the leads. They are fairly easy to find

Jim,
Welcome to the group, and I'd agree with Stewarts comments about the flexible battle whip (the short, plastic-covered one), being good as, or possibly better than the longer 4ft sectionalised whip. Back in the UK, I checked this out with a couple of radios, and a field strength meter about 20ft away, and the shorter whip does get out better, at least on 50MHz and 70MHz.

The reason behind this may be the pre-set matching that feeds the whip, and is controlled by the decade switches to set the frequency, as they are not tunable like on some US radios, like the PRC-68.

Yes, Graham, the guy at gten98 on ebay, is very good with his prices, and also is about as cheap and quick as you can get shipping to the US: I think he must get a bulk rate with DHL, as he can get stuff from door to door, in about 5 days normally, a lot cheaper than an individual shipment person to person from the UK to the US.

Considering the numbers of PRC-25/77's that the US must have had, they are very pricey in the US, and if they have been fiddled with can produce some hard to fix problems with the frequency selection. They do have the advantage that you can fit an AT-271 antenna to them though, and put out a hefty signal. Nice radio's, though easier to service with pluggable modules if you have the Test Set and spare modules to play with.

One thing to consider with the PRC-351 is getting a SURF unit for it (Selector Unit Radio Frequency): this is'nt needed for it's intended purpose (to allow the radio to operate near other radios on nearby channels), but is a very handy way of making up a 20W manpack. The 352 variant has a clip-on 20W amp, which goes between the battery and the radio, but is intended to then be used as a ground staion only, into aremote ground-spike antenna: a common work-around in service was to fir the SURF on top of the radio, add an extra BNC-BNC jumper lead, and the attach your whip to the antenna base on the SURF.
The SURF is tuned up on low power (4W), and when you switche the amp on, the needle on the little rf output meter on the SURF pings over hard, but it all works well enough.

Obviously running the amp eats into your battery life, but it will work into the whip and is SWR-protected, so if you get too close to the antenna, or grap hold of it, it will trip the amp out and you go back to 4W.

Best 73

Al

Subject: [351] Introduction

Hello all,
I'd like to say hello and thanks for allowing me to join this new group. I've developed an interest in HAm Radio lately and currently own a Kenwood TS-50 I pulled from a sailboat I bought awhile ago. I'm working on my Tech license and hope to have it soon. I served in the US Army for 22 years and am retired and wanted to do some green radio collecting and use something similar to what I used in the Army, A PRC-77 but they are hard to find, too old and prices are expensive. I found out about the PRC-351 has the same freq range and and is newer tech and the prices are just right. I just bought a PRC kit (RT351, 1.1Ah Battery NC, Headset & pressel, 0.6m Flexable Antenna, and carrying frame GS) from a guy selling them in dereham Norfork, UK and his prices are low at 40GBP. Looking forward to adding extra upgrades like a longer whip and 20 amp to boost the power. Pictures will be posted when it arrives. I just I receive good equipment when it arrives.

Thanks,

Jim

Good advice. I did exactly this and have the SURF and the amplifier. Great set up.
SURF = Selector unit radio frequency.
I have one on my 351 and 352
Cheers
Stewart

Well it seems that getting a SURF and the 20watt amp is the next items I'll need along with a battery charger. I'll see how things look once my radio set arrives, hopefully this week it it doesn't run into any US Customs issues. Keeping my fingers crossed.

Thanks,
Jim

Good Luck
What you want is a SURF 4W and a DCCU14 charger
Cheers

OK,
My wife just called and told me my PRC-351 radio kit has arrived. It was shipped on Friday by DHL and just arrived at my front door. So, no customs issues which is cool. I'll post pictures later along with setup photos and see if it powers up.

Jim

Ok,
Guys, everything has been unpacked, the package was very light compared to some manpack radios. Condition of the gear looked pretty good, a bit dusty and a 1.5amp/hr battery with some rust on the corners. The headset/mic and the pressel (push to talk) are new and sealed. Whip antenna looks as it should. While digging throug the box I found a half ate sandwich (ugh, looks like Nuttela and toast). Next job, assembly and sound test. Pictures are posted.

So now to fire it up and see how it goes, Jim. I never received a food parcel on any goods I got from him
:-(
If you look at the headphones you will see you can remove one unit. It has a clip on it so you can hear the rest of the world while listening to the radio
Cheers

Jim,
It looks in pretty good shape, and you certainly got enough bits with it: the General Service carrying frame is a very tough frame, and is the same as is used with the British Army's Para/SAS bergan rucksack. It's a bit heavier than the lightweight carry frame, but much stronger.

Not sure about the half eaten toast, maybe they shipped around breakfast time!

After I took the pictures, I cleaned up the gear, connected everything and did a quick test. It seems to work fine. Of couse since I don't have my license yet (soon) I'll be patient and maybe do some monitoring, maybe whip up a long antenna and see what I can pick up. Next I need a charger and a spare battery and later a surf and maybe the 20 watt amp? My wife likes it so that a go ahead to buy more stuff. I tell you, at 40 pounds for the kit plus 50 more for shipping, it's a great deal! Maybe by end of year I can swing a PRC-320?

Thanks Guys for the kind remarks,
Jim

> Ok,
> Guys, everything has been unpacked, the package was very light compared to some manpack radios. Condition of the gear looked pretty good, a bit dusty and a 1.5amp/hr battery with some rust on the corners. The headset/mic and the pressel (push to talk) are new and sealed. Whip antenna looks as it should. While digging throug the box I found a half ate sandwich (ugh, looks like Nuttela and toast). Next job, assembly and sound test. Pictures are posted.

27. Presentation on Clansman Radios

Yahoo group: Clansman351
Date: 2011-06-05 10:41:15 UTC
From: Stewart Gebbie
Topic: 27 Message: 27

Hi all
In the files area I have uploaded a presentation i give to radio clubs along with a demo. It focuses on the 351 / 52 /and the 320. The purpose of the presentation ios to introduce radio amateurs who have not seen or experienced Clansman and is a quick look at what is useful to the radio amateur. It is not a complete treatise on Clansman! It is in pdf format and is for your personal use only. This is because some of the photographs are owned by kind amateurs who allowed me to use them and they are acknowledged in the presentation. the original version was checked through by several VMARS members and I made corrections ..please let me have feedack if you spot any more errors
Cheers
Stewart

28. Delay in Getting Presentation on Line

Yahoo group: Clansman351
Date: 2011-06-05 11:02:19 UTC
From: Stewart Gebbie
Topic: 28 Message: 28

Sorry the Clansman file will be posted soon. It was too big to be posted so I am compressing the pictures in the file which will mean reduced quality but will enable the file t be uploaded.
cheers
Stewart G8YQN

29. New file uploaded to 351

A very minor point Stuart, but I have seen rechargeable lithium batteries that were recharged by the normal DCCU. They have a little battery state display. I saw one at a Chatham Docks militaria fair and have regretted ever since not getting one, but for normal amateur use the standard batteries are more than adequate. I do have the contact details for the chap selling them if you are really interested.

31. Lithium Batteries

Yahoo group: Clansman351
Date: 2011-06-05 21:01:36 UTC
From: Stewart Gebbie
Topic: 31 Message: 31

Rechargeable lithium? I have some non rechargeable lithium batteries. Much higher capacity than Ni cads and much lighter the Ni cads. I have not seen the batteries you mention. They must have been used in the latter stages of Clansman in service. I would greatly appreciate the info. How much are they?
Cheers
Stewart G8YQN

32. Re: Rechargable Lithium batteries for Clansman

From: alan belton
Topic: 27 Message: 32

Gordon,
I'm interested in sightings of the rechargable Lithium batteries: these were a very late venture in the life of Clansman, and I think were more designed for the "22 legacy items of kit that still used the Clansman 4Ah battery", when Bowman came out. (I have one back in the UK, with one of the internal cells dead, dated 2005). This was a Fujitsu product, in a standard Clansman plastic batter case.

There were two sorts, I believe, one with a standard charge socket on the side, to connect to a DCCU, where the internal charge regulator card in the Lithium battery effectively told the DCCU to stop charging, by generating an end-of-charge differential once the battery was charged. The other type had a square moulded plastic socket, for a specialised charger, and a warning label about not charging them via the output contacts.

From memory, these were rated at 12Ah, and a fair bit lighter then the normal NiCad equivalent, so would be interested if these were becoming available now? (Some of the legacy kit is now being discontinued, so quite possibly associated with that, in terms of disposals and auctions, etc). Other than that, some of the earlier Lithium rechargable batteries are now being dumped, as they were found to have the potential for explosion or fire if penetrated by fragments or burned.

The fact that Litium batteries can cause a fire if exposed to air is nothing new - one just lives with that and a Toshiba computer had such a problem, I think, with a manufacturers recall. Many years ago Duracel had a special cage to s tore them in the factory in Crawley.

One difference is that in amateur use they are not so likely to get holes pierced right through them and out the other side - or does the ballistics mean they turn on entry as with other things they are aimed at??!

Mike,
You would like to think that most radio amateurs are unlikely to get fragged whilst carrying their radio with a lithium battery, but you never know, lots of re-enactors about!

I don't think there are any fancy ballistics, high velocity stuff just goes clean through most things, and radios and batteries are not an obstacle,. The only difference on later Bowman batteries is that the individual cells inside the packs have a venting bung so that a cell that shorted out at the terminals would de-pressurise rather then explode.

I'm not aware that the lithium compound inside a normal battery burns on exposure to air (like phosphorus does), but like the other very light metals it burns well enough once ignited. (Lithium batteries in Toughbooks used in a secure environment seem to go through a pulverising mill easily enough without any fireworks when the laptop is destroyed at end of life/use/project/task)

I had not realised we were that paranoid about security that it ALL got pulverised. The hard drive I can understand - what a wate to the environment. I wonder when that will get stopped and the need to conserve our resources is seen?

Re Lithium, perhaps the compound has changed over the years?

Are Bowman batteries Lithium now? But still heavy like the Ni-Cad Clansman we all know?

Are you now staying in your current job permanenetly, now?!!!

Mike,
I think complete destruction of laptops and similar kit used above certain levels has been the case for a good few years now, and is likley to continue. It saves any possible problems later on, and is very final. There are very few true military laptops now, as it is far cheaper to buy COTS Toughbooks, and accept they will probably have a short, but useful life, before the innards are destroyed by fine dust and grit, and overheat.

Bowman batteries are comparable in weight with the Clansman Lithium primary batteries, nowhere near as heavy as an old Nicad, but varies with the radio, and the size. The fuel-guages are now more accessible,and match the radios software better, to give an accurate assesment of life left: not the "sudden-death" effect of a nicad reaching the end it's discharge cycle.

Highly scientific experiment today, involving dumpsters, and current Harris lithium primary batteries: taking one apart with a Leatherman tool and a Ka-Bar did'nt result in self-immolation or spontaeous human combustion, nothing fizzed, burned or did much at all actually: I'd guess the individual "mini-sardine can" cells have an internal fuse link, as they would spark quite hard briefly if shorted, then nothing. Innards had a strong chemical smell to them, but did'nt discolour the knife blade, and looked like a thick grey paste, with a mesh liner. Definitely a "don't try this at home" thing! The racoons in the dumpster in the mornings are nasty enough already without growing extra heads....

Not here permanently, hope to get home at some point, only currently extended until the bean-counters get their act together and get my colleague out here, hopefully only a few more weeks: have missed the ESWR, which I had hoped to get to if I'd been back as planned.

38. Rechargeable Lithium Batteries - contact details

Yahoo group: Clansman351
Date: 2011-06-11 17:51:32 UTC
From: g
Topic: 38 Message: 38

Gentlemen and others,

I have been in touch with the man with the batteries and he still has some at £10 each plus delivery. Possible reduction for quantity. He is in Rainham, Kent and amenable to collection from his home with sufficient notice. He is happy for me to give out his email address but I'm not sure I should broadcast it, so if you are interested let me know and I'll give you his details.

73,
Gordon

39. PRC-352 SURF unit with rubber, short, Battlefield Whip

Yahoo group: Clansman351
Date: 2011-06-11 19:09:30 UTC
From: Blooptube
Topic: 12 Message: 39

Hi Al,
"One thing to consider with the PRC-351 is getting a SURF unit for it (Selector Unit Radio Frequency): this is'nt needed for it's intended purpose (to allow the radio to operate near other radios on nearby channels), but is a very handy way of making up a 20W manpack.Â The 352 variant has a clip-on 20W amp, which goes between the battery and the radio, but is intended to then be used as a ground staion only, into aremote ground-spike antenna: a common work-around in service was to fir the SURF on top of the radio, add an extra BNC-BNC jumper lead, and the attach your whip to the antenna base on the SURF.
> The SURF is tuned up on low power (4W), and when you switche the amp on, the needle on the little rf output meter on the SURF pings over hard, but it all works well enough."

Are you referring to the long jumper between the SURF unit output into the 20 Watt Amplifier RF input ?

And leaving off any coax connected antenna from the 20 watt amp.?

Then attaching the short rubber battlefiled whip to the SURF unit?

If not, what are you referring to when you say "add an extra BNC-BNC jumper lead" ? Attach from where to where?

Thanks a lot.

Bob

Bob,

In stages:
1. Connect aerial to SURF and SURF to 351 as for normal use using short BNC to BNC cable 5995-99-620-8030 or equivalent. Tune SURF. Leave aerial on.
2. Disconnect SURF from 351, discarding the short BNC to BNC cable. Add 352 to 351.
3. Connect 352 input to 351 output.
4. Connect 352 output to SURF input.
5. Select appropriate band on 352 and away you go, as has been said, pinging the SURF needle merrily.

Stage 3 or 4 will require you to make up your own 50 ohm BNC to BNC cable as their isn't an issue cable for this setup.

Gordon.

Bob,
Gordon beat me to it, with some better instructions then I gave!

There is no EMER covering this assembly, as it was unofficial (but used quite a lot to make the radio more flexible).

The local source of BNC-BNC cables in military use was the short TUAAM BNC cable, which had a right-angled BNC at one end, and and ordinary one at the other, just about the right length, and the right-angle sat tidily with the socket it fitted onto..

Once working, bear in mind that the amplifier can and will drop out, if the antenna waves about too much, as the SWR trip will activate in the amp: Powering it up and down will reset it. Another potential trap is setting the amp to the wrong band, where it will not produce the rated power output.

The use of the amplifier also introduces DC onto the inner of the RF output socket, for confidence testing purposes, which needs to be considered if you run it into a dc-shunted antenna (ie, not the supplied whip). Otherwise, it cuts the sidetone out in the earpiece if there is no DC continuity through the amp. With a bit of thought you could probably use the DC level on the RF output to switch a pre-set into line with the meter in the SURF, so it read normally on high power, when running the amp.

42. [Clansman351] 351 group name/addresses have changed

Yahoo group: Clansman351
Date: 2011-06-12 07:27:02 UTC
From: notify@yahoogroups.com
Topic: 42 Message: 42

Hello,

The moderator of the 351 group has changed the group's name.
This means that both the group's email address and the group home page
location have changed.

The group email address:
Clansman351@yahoogroups.com

The group home page location:
http://groups.yahoo.com/group/Clansman351

If you have links which point to this group or an address book entry
for the group, you should update them, as the old addresses will no
longer work.

Regards,

Yahoo! Groups Customer Care

Gordon & Al,

It has been explained very well by both of you and I thank you for that.

I tried it last night and it works just as advertized !

Now I am off to the field today to see how the rubber battlefield whip compares with the steel whip as a 20 watt backpack. Of course I already know the answer, but I have to prove it to myself!

Once again, many thanks for explaining in detail how to make my PRC-352 more efficacious.

Bob

This is the charger I use. Hardly use the DCCU, about £38 pounds or about $50. there is a picture of the leaflet and address in the UK etc in the photo gallery here,

http://groups.yahoo.com/group/Clansman351/photos/album/982274125/pic/976709085/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc

it does 12v 350 batts too!

This charger looked so convenient, I have just bought one. The 14V DCCU gets so hot when charging the batteries I fear it's going to cook itself.
Then charger is £35 and there is no shipping fee.
Cheers

These chargers are made in China and should be available in the US. I just bought one for £35
It will be cheaper than buying the DCCU 14v as these sell for about £40 and you then need to get the cables too.

Please let us know if you get one in the USA. Be careful if ordering from the UK because our mains supply is 230v and yours is 110v. Most chargers are universal 90v-250v but it is always best to make sure....
Cheers

I've email the company in the UK and they confirm it'll work using US PC 110 powercord. I'll order one later to day. Plus I'll post the picture they sent me. Once I receive it and test a charge I'll let everyone know how well it works.

Jim

From: Stewart Gebbie
Topic: 11 Message: 58

I got the new charger. I have charged a completely flat battery and it cut off when fully charged . It is an excellent solution.
I recommend this ESP charger.
Cheers

It will wink at you strangely on a low battery but if you put a meter across it you will see it is quietly stepping up the voltage like a mecca pilgrimage, 2 forward steps and one back etc.

From: Jim
Topic: 60 Message: 60

Hello all,
Yesterday I took my Technician test in Stafford Va and passed with flying colors. I was also asked if I wanted to take the General class test free so I did and got 26 out of 35 questions right. Only thing was some elements I didn't pass so no General license. But this gives me motivation to study so I can pass the General during testing in the next month or two. So, I now wait until my call sign sign shows up in the FCC or ARRL register and then I'm on the air. I ordered the battery charger we discussed earlier for my only PRC-351. Next week in the US is ARRL Field day and hams across the US will be broadcasting for 24 hours next Saturday and Sunday practicing emergency procedures and hopefully I'll be sending out some CQ's ansd make some contracts.

Have fun!

Here's a possible dumb question about emergency battery charging, We know the batteries for the PRC-351/320 are 24 volt, would the battery take a charge if you connected a 12volt charger similar to what's used on auto batteries? I know the voltages don't match, but in a pinch, could it work?

No is the answer. You could always get a hand generator that is made for the Clansman. Doubles as an arm muscle developer too !
Cheers
Stewart

Subject: [Clansman351] Passed by Tech test

Hello all,
Yesterday I took my Technician test in Stafford Va and passed with flying colors. I was also asked if I wanted to take the General class test free so I did and got 26 out of 35 questions right. Only thing was some elements I didn't pass so no General license. But this gives me motivation to study so I can pass the General during testing in the next month or two. So, I now wait until my call sign sign shows up in the FCC or ARRL register and then I'm on the air. I ordered the battery charger we discussed earlier for my only PRC-351. Next week in the US is ARRL Field day and hams across the US will be broadcasting for 24 hours next Saturday and Sunday practicing emergency procedures and hopefully I'll be sending out some CQ's ansd make some contracts.

Have fun!

Jim,
Congratulations on your pass, hope the callsign gets onto the reguster for the ARRL Field Day next weekend: not sure what I'm doing yet, but may be involved with the Tampa Amateur Radio Club and their efforts if I'm not working.

12V car chargers: not a lot of good, would take a very flat battery up to about 13 volts, but no further. (And there is no real current limiting) Clansman batteries should'nt (in theory) go below about 20-21 volts when discharged (the level that the 351 starts making "chuffing noises", as there is a risk or damaging the cells.

Best 73

Al

Well, about as expected. Anyway, waiting for the proper charger to show up and also expect to order a larger battery (4amp) to use.

Jim

Topic: 11 Message: 66

Make sure and the 14 volt INPUT charger. It is called a DCCU (Direct Current Charging Unit). You can run it from a car battery or typical ham radio power supply. It draws about 4 Amps on charge. Note also when buying they usually do NOT come with the input or the special cable to charge the battery. Make sure you check. Cables can be found easy enough
Cheers
Stewart

Well, about as expected. Anyway, waiting for the proper charger to show up and also expect to order a larger battery (4amp) to use.

From: psgebbie@sky.com
Topic: 11 Message: 68

With this charger, what you could do is get an empty pack and fill it with D cells connecting them up in series. (Connecting tem in a chain). This will get you a 4Ah battery with brand new cells. You will not need to worry about connecting the diodes in this pack as you are charging with ESP charger.
Cheers
Stewart

> Hello all,
> Yesterday I took my Technician test in Stafford Va and passed with flying colors. I was also asked if I wanted to take the General class test free so I did and got 26 out of 35 questions right. Only thing was some elements I didn't pass so no General license. But this gives me motivation to study so I can pass the General during testing in the next month or two. So, I now wait until my call sign sign shows up in the FCC or ARRL register and then I'm on the air. I ordered the battery charger we discussed earlier for my only PRC-351. Next week in the US is ARRL Field day and hams across the US will be broadcasting for 24 hours next Saturday and Sunday practicing emergency procedures and hopefully I'll be sending out some CQ's ansd make some contracts.

70. QSO contacts with your PRC-351

Yahoo group: Clansman351
Date: 2011-06-24 18:03:05 UTC
From: Jim
Topic: 70 Message: 70

How much luck has anyone made in making QSO contacts using your PRC-351 with various antennas and at what distance was your longest contact?
I have the basic RT351 with the .6 meter whip and 1 amp battery. With ARRL feild day tomorrow I'll see what happens.

20 odd miles Hilltop to hill top, should be possible to do better .4 watts slightly scratchy, 20 watts full on, doesn't like hills in the way. doesn't penetrate or diffract like 2 meters. Suspect it does not like leafy wet trees either! Why did the military not choose 2 meters?

There are two whips the 351 a four section whip and the battle whip which is the bendy one. It seems that the latter works better not because it is a better antenna but because the radio seems optimised to work on this antenna. I have a copy of the troop commander s chart for calculating the range over a given terrain at a given frequency and it is designed for Western Europe.
When I can get to my pc I will upload it tom the files area. It takes the guess work out of the equation in calculating range.
Cheers

75. British army Range calculator for 351 352 353 radios

Yahoo group: Clansman351
Date: 2011-06-25 07:45:44 UTC
From: stewartgebbie
Topic: 75 Message: 75

I have uploaded the file to the file are which is the calculation sheetto work out the range on VHF for any of the above radios and assumes you have some knowledge of the terrain. It is designed for Western Europe use but is still useful. It reminded me that the best place is to get high and on a cliff edge for the best range.
Keep in mind that is deisgned to ensure solid communications for field use as opposed to us radio amateur radio guys who will push the range to the limits and accept really noisy signals etc.
It would be good to get feedback on whther this is actually accurate or otherwise.
Cheers
Stewart G8YQN

Hi Iain
I re-sprayed one of my 320's at the weekend.
See attached

These two cases may be of interest to somebody.

The original RT351 seems to have had provision for some sort of carrying
frame - ie the loop in the middle of the case.
It also used the very small (BNC type) connector that was used on the 350.

These have incomplete guts by the way!

I do have a few spare cases for these and the 352 amps if anybody wants
one, and one with what looks like a real, original, bullet hole!

Mike B

82. EVHF " pineapple" antenna and mast or ground spike antenna

Yahoo group: Clansman351
Date: 2011-07-01 13:23:03 UTC
From: Stewart Gebbie
Topic: 82 Message: 82

Hi all
I woul like to get my hands on a ground spike antenna and/ or evhf pineapple antenna. They are superbly expensive on EBay these days and I have not yet found the ground spike antenna. Any suggestions on a reasonably priced supply would be really appreciated.
Cheers
Stewart G8YQN

Hi Paul
I bought an amp off the famous auction site and paid around £10. It works perfectly but looked extremely rough and the piece of a fin missing. I rubbed it all doen, masked it up and sprayed it today. It looks better than the £40 ones. it only took me ywo hours start to finish. I will put it back together (about 15 min job) tomorrow when the paint is dry.
my conclusion ..buy it cheap and painting it is really easy.
Cheers

92. Ground mounted monopole antennas

Yahoo group: Clansman351
Date: 2011-07-03 19:57:19 UTC
From: slack5874
Topic: 92 Message: 92

Hi group

Can someone tell me how these ground mounted monopole antennas work and what kind of radio wave shape they emit compared to a whip?

They are pretty big, so I'm hoping they are actually worth all that extra bulk and aren't just a pretty display piece!

They're essentially a broadband monopole (an inverted cone fed against a mesh groundplane), and are negative gain, to say the least. You'll get a better result out of a GSA goundspike/whip set-up overall. Although spec-ed for 30-88MHz, they work well above it, and radiate (after a fashion) on the VHF and UHF airband as well.

These antennae were designed for use with full-range hoppers. or where a low-gain no-tune radiator was required, such as a Command Post.

They are very good for drying your dhobi on though!

Good question STeve. Also it would be good to get feedback on the performance. Which band do they work best? Do they have gain ? If so what?
Cheers
Stewart

Al

Interesting to see your comments

I was led to belive, in training, they were one of the better a/e electrically. The EVHF the worst. BTW the EVHF works fine on 144 or so, again a user comment rather than an electrical test!

Mike,
Possibly the trainer was quoting the manufacturers pamphlet!

Despite the portly gentleman in the sandy beret (item #140564380549) reckoning it's just the job for covert ops, etc, etc, it's only ever going to be a broadband vertical radiator, with a very bumpy SWR pattern, like the GSA.

You can't elevate it, which is the main key to success with the military antennae, so it will always be pegged to the ground, and if you drape a cam-net over it (and it gets wet), it will do even less well). I think it's success is based on the EVHF ethos of "shove more power up it until it works", as 50W of hopping VHF will work well enough on full-range hop sets, whereas the EVHF wasn't at all happy doing that, with it's strange resonances and tendency to cook the base connector to the feed mast.

The elevated GSA worked quite well on narrow (ie, 6.4MHz) hopsets, as you'd expect, as that would be well within the bandwidth of the antenna is it was about the right length, but something running 30-108MHz would suffer badly into the same antenna.

The positive side of the ground mounted monopole was that you could more or less fit and forget it, it required no tuning, and could be sand-bagged down on the roof of an ISO container or similar to get some elevation, and as long as you had the requisite C to BNC adapter leads it would take RF from anything in the CNR range.
The other major positive, (unlikely to be of much use to amateurs), was that it had a high radiation angle and worked very well in terms of ground to air working, and would usually maintain comms over a much longer range to a CNR equipped helicopter when compared with UHF kit into the less then efficient "Bob Marley" antenna.

I don't have access to Janes currently, but I think the gain used to be quoted as -6dB, on average. There were spot frequencies when older set's simply wouldn't have it, presumably as the SWR was far too high, and the fix there was to add a C to C extension lead in line with it, to move the hotspot. (The cable proabably radiated better then the rotary clothes line).

Such was my enthuthiasm for the thing that I dumped the one I had in a skip when I cleared my garage out 6 years ago to move....

On the other hand if there's any DXers out there with better results, I'll stand corrected.....

Interesting to see your comments

I was led to belive, in training, they were one of the better a/e electrically. The EVHF the worst. BTW the EVHF works fine on 144 or so, again a user comment rather than an electrical test!

The rotary washing line. I don't think there are any matching components at all in the feed/hub behind the "C" connector, whereas the GSA has an auto-transformer feed that limits out of band operation.

Mike,
But it has, of course been used by Andy McKn*b, and could quite easily have been used on the Embassy balcony, as it is special forces. No Walt should be without one, purely on those grounds: if you hung washing on it, it would be just the thing for an urban OP, no-one would spot it then.

From: Stewart Gebbie
Topic: 92 Message: 102

So its Monday and my wife has the washing out to dry on a trianugular
washing line which looks a comple structure . Maybe I should just hook
up a length of coax onto that and put a BNC on the other end. Hey
presto a camouflaged VHF antenna for urban surveillance.....and its
NEVER been in the field (just the back garden) and never been rented out..
Cheers
Stewart

Or cares.

For a picture of Andy himself, see eBay #140569953435, which would suggest he'd need a cherry-picker to get on any balconies these days.

Subject: Re: [Clansman351] Ground mounted monopole antennas

So its Monday and my wife has the washing out to dry on a trianugular washing line which looks a comple structure . Maybe I should just hook up a length of coax onto that and put a BNC on the other end. Hey presto a camouflaged VHF antenna for urban surveillance.....and its NEVER been in the field (just the back garden) and never been rented out..
Cheers
Stewart

Mike,

But it has, of course been used by Andy McKn*b, and could quite easily have been used on the Embassy balcony, as it is special forces. No Walt should be without one, purely on those grounds: if you hung washing on it, it would be just the thing for an urban OP, no-one would spot it then.

On 04/07/2011 02:20, alan belton wrote:

Mike,

Possibly the trainer was quoting the manufacturers pamphlet!

Despite the portly gentleman in the sandy beret (item #140564380549) reckoning it's just the job for covert ops, etc, etc, it's only ever going to be a broadband vertical radiator, with a very bumpy SWR pattern, like the GSA.

You can't elevate it, which is the main key to success with the military antennae, so it will always be pegged to the ground, and if you drape a cam-net over it (and it gets wet), it will do even less well). I think it's success is based on the EVHF ethos of "shove more power up it until it works", as 50W of hopping VHF will work well enough on full-range hop sets, whereas the EVHF wasn't at all happy doing that, with it's strange resonances and tendency to cook the base connector to the feed mast.

The elevated GSA worked quite well on narrow (ie, 6.4MHz) hopsets, as you'd expect, as that would be well within the bandwidth of the antenna is it was about the right length, but something running 30-108MHz would suffer badly into the same antenna.

The positive side of the ground mounted monopole was that you could more or less fit and forget it, it required no tuning, and could be sand-bagged down on the roof of an ISO container or similar to get some elevation, and as long as you had the requisite C to BNC adapter leads it would take RF from anything in the CNR range.

The other major positive, (unlikely to be of much use to amateurs), was that it had a high radiation angle and worked very well in terms of ground to air working, and would usually maintain comms over a much longer range to a CNR equipped helicopter when compared with UHF kit into the less then efficient "Bob Marley" antenna.

I don't have access to Janes currently, but I think the gain used to be quoted as -6dB, on average. There were spot frequencies when older set's simply wouldn't have it, presumably as the SWR was far too high, and the fix there was to add a C to C extension lead in line with it, to move the hotspot. (The cable proabably radiated better then the rotary clothes line).

Such was my enthuthiasm for the thing that I dumped the one I had in a skip when I cleared my garage out 6 years ago to move....

On the other hand if there's any DXers out there with better results, I'll stand corrected.....

Interesting to see your comments

I was led to belive, in training, they were one of the better a/e electrically. The EVHF the worst. BTW the EVHF works fine on 144 or so, again a user comment rather than an electrical test!

Mike B

On 03/07/2011 22:31, alan belton wrote:

They're essentially a broadband monopole (an inverted cone fed against a mesh groundplane), and are negative gain, to say the least. You'll get a better result out of a GSA goundspike/whip set-up overall. Although spec-ed for 30-88MHz, they work well above it, and radiate (after a fashion) on the VHF and UHF airband as well.

These antennae were designed for use with full-range hoppers. or where a low-gain no-tune radiator was required, such as a Command Post.

They are very good for drying your dhobi on though!

Hi group

Can someone tell me how these ground mounted monopole antennas work and what kind of radio wave shape they emit compared to a whip?

They are pretty big, so I'm hoping they are actually worth all that extra bulk and aren't just a pretty display piece!

Hi all
I added a new front page photo of one of my PRC352's so you that there is a larger picture on the front page. For those who have not seen this set up :
On the top is the Surf 4W, then the RT351 radio, then the 20W RF Amplifier (if I remember correctly is the AM352) and of course the 24V battery. The battle whip is connected to the SURF so that I can use it with the amp off so this is running the 4W out and is effectively a PRC351. I connect an external antenna to the amp when I want to operate at 20W. I am awaiting a GSA (Ground Spike Antenna) arriving to make the kit portable and complete (at least for me)
Cheers
Stewart G8YQN

122. Re: [Clansman351] Ebayer Question

Topic: 119 Message: 122

Hello,

eBay dealer Alpha*Alpha has been the subject of discussion on several military radio groups:

73, Bruce WA8TNC

-------- Original Message --------
Subject: [armyradios] Problems with an ebay seller alpha*alpha
Date: Thu, 28 Apr 2011 11:34:27 -0000
From: Walter <walter.skavinsky@...>
Reply-To: armyradios@yahoogroups.com
To: armyradios@yahoogroups.com

In the spirit of Caveat Emptor I thought I would share my experience with a prominent eBay seller alpha*alpha. Last September I did an outside eBay sale for a prc320 package which was to include a counterpoise. The package was received and all was ok except a missing counterpoise. Emails to the seller went ignored. I sent thru eBay attached to other items he had for sale as well as thru other address that were found. After 21 emails there was no reply. I got a good deal so I let it go. I found he had another part I needed and I purchased thru eBay and received it without trouble. So on 2-19 and 2-24 I ordered counterpoise wires. I received 1 of the counterpoise and there was extensive delay 40 days. The second never came and I waited too long and could not appeal thru eBay. On 4-2 I ordered an anr headset assuming it was just delays in the mail I made this purchase with some reservation. Now I have not received the second counterpoise or the headset and I have sent repeated emails. This seller has around $100 usd from me he has not sent any items. I should have waited before ordering again but I made an assumption that it was just mail delays but the lack of communication is inexcusable. I'm not making any blanket statement this is just an account of my experience with the seller. Some friends have had very positive and some have also had the same issues as me. So as I said before "Caveat Emptor"

From the Owner of the PRC319 Yahoo Group:

5/17/2011 6:41 AM

Alpha*Alpha...aka alphaa_jt2349ob@... (eBay Seller).
Jeremy Roche

123. Ground Spike antenna

Yahoo group: Clansman351
Date: 2011-07-08 18:11:28 UTC
From: Stewart Gebbie
Topic: 123 Message: 123

I got my GSA today. I took a picture with my 352 which I renovated over the past weeks. Net step is to get a 5 metre mast to get the antenna in the air. I posted the picture in the files area.
I really need now to test out this set up on the air with a QSO or two.
Cheers

Nice one Stewart!

Mine works fine (SWR wise) in my damp lawn, but up on the sandy hill it works a lot better with counterpoise radials, a marked improvement on received sigs even with one radial!

Thanks Robin. and your point noted. I have the 320 counterpoise kit so I will use that .
Obviously don't need the long lengths at 70Mhz though !!

126. VHF Path Anaysis Spreadsheet

Yahoo group: Clansman351
Date: 2011-07-08 20:11:01 UTC
From: Stewart Gebbie
Topic: 126 Message: 126

Hi all
An Excel spreadsheet version of the Troop Commanders Spreadsheet has been added to the files area. This spreadsheet does the calculations automatically that are mentioned in the British Army Troop Commanders Calculation sheet. It enables you to work out at a given distance if you will be able to communicate using our Clansman radios on VHF 30-76Mhz.
Have a play with it, it is interesting to see the difference the landscape makes and also what happens hen changing the frequesncy.
Note that the "drop don menus2 will not work using OPEN OFFICE spreadsheets so you really have to use Microsoft Excel.
Thanks to Iain G0OZS for giving me permission to put this on this group.
Cheers
Stewart G8YQN

127. Farnham Weymouth and back

128. On the Air Form North Yorkshire Wolds 10 th July

Yahoo group: Clansman351
Date: 2011-07-09 08:57:20 UTC
From: Stewart Gebbie
Topic: 128 Message: 128

Hi All
I will be on air with my Clansman radios on the North Yorkshire Wollds on Sunday 10th July local time 2-4pm.
I will be active as follows :-

PRC 320 on HF USB in Mhz
5371.5
5403.5
7065.0
If the higher HF bands prove workable then also on the HF Pack calling frequencies
14.3425
18.1575
Primary operation will be on 5403.5 and 18.1575

PRC352 FM in Mhz
51.50
70.45
Cheers
Stewart G8YQN

133. Counterpoise Use on a PRC-351

Yahoo group: Clansman351
Date: 2011-08-01 20:59:45 UTC
From: Jim
Topic: 133 Message: 133

Can a wire counter-poise be used on a PRC-351 if you using a 1.2 meter whip antenna? I know you can use either a whip or a wire antenna on the BNC connector? I'm looking for a way to get some small increase in range since repeaters on 6-meters seem to be hard to fine and the range is limited.

Thanks,
Jim KK4CWO

134. Re: [Clansman351] Counterpoise Use on a PRC-351

Yahoo group: Clansman351

From: alan belton
Topic: 133 Message: 134

Jim,
There was'nt a specific counterpoise designed for the 351 (although there was a wire antenna, that looked just like one, with an antenna connector on one end), but adding one would'nt do any harm. For 50MHz, you'd be looking at a wire about 5ft long as a counterpoise.

I'm not sure what overall benefit you'd get at 50MHz, and if you'd be able to work repeaters, given that the 351 is a 25kHz channeled radio, and simplex only (ie, it can't transmit on a frequency different from it's receive frequency)

A general observation (not based on any particular scientific experiment) is that the shorter plastic "battle whip" seems to radiate better on 50MHz, then the longer 4ft whip: this may be due to the internal matching arrangements for the whip antennae, which will be something other then 50ohms, due to the decade switches providing a degree of tuning and loading of the whip antenna.

The wire antenna was only for short range working, and rarely used in service.

The BNC socket is 50 ohms, and can be used to connect to an external antenna, like the Ground Spike Antenna (GSA), or the same GSA on an elevation kit, to get better height.

Hope that helps,

73

Al

Hi Jim
I agree with Alan's reply.
There are two 351 antennae. One is the fleible battle whip and the other is the rigid 4 section whip. The battle whip I have found actually works better than the rigid antenna.
The gound spike antenna will improve the range but to get the best results you need to elevate it, otherwise there is a not a lot of improvement over the battle whip.
The other improvement to consider when funds permit, hunt around for a cheap AM352 amplifier that givers you 20 watts out.
They do occassionally appear. I bought a cheap one that worked perfectly but the paintwork was awful. I repainted it. You can see it in the picture on the opening page of this group.
The daft /simple solution of course is to stick a 1/4 wave magmount on the car ! Not very portable though!!
Cheers

OK thanks, I guess what I'll do is switch back from the 1.2 meter antenna back to the battle whip and see how it does. I tried making some contacts last night on 50.125 Mhz and someone must have heard me but all I got was static hiss coming back. I'll see what happens this evening. Otherwise I'll see if I cam make a dipole or buy one for 6-meters and hope for the best.

Thanks,

Jim,
It may be worth while hooking up with someone with 50MHz FM gear as close to you as possible, just to get basic comms going, with a known strong signal? I think in the US, 51.000 and 51.500 get used for green radios, but it does need someone on the other end when you call!

Back home in the UK, I can get a fairly easy 30 miles or so range from a rooftop mounted triband colinear antenna with a 352, but again, that really needs someone to be about, or known to be monitoring the channel.

The UK 50MHz repeaters are on different channel spacings to the 25kHz channels of military gear, so you can't use the repeaters unfortunately.

Overall, height is what makes the most difference, so a home made dipole as high as possible would be a start. The extra power of the 20W amplifier can also be useful, as neither of the military whips are optimised for 50MHz.

From: Stewart Gebbie
Topic: 143 Message: 143

Hi allIn order to make it easy to plan skeds on VHF and HF Clansmans a new Yahoo group is being set up. This need was particularly felt on the HF forums due to the number of sked messages . Fo rthe VHF radios it would also be helpful.
Please go to the following linkand join.
Please go http://groups.yahoo.com/group/clansmanskeds/
<http://groups.yahoo.com/group/clansmanskeds/>
This is NOT a splinter group. Its purpoe is to make a place where people can arrange skeds and so everyone can enjoy the fun of using their Clansmans (or should it be Clansmen??)
<http://groups.yahoo.com/group/clansmanskeds/> Enjoy!CheersStewart G8YQN

144. PRC-352 Amplifier

Yahoo group: Clansman351
Date: 2011-08-15 01:17:35 UTC
From: Blooptube
Topic: 144 Message: 144

Good evening all.

Is there any reason that I cannot or should not hook up my PRC-77 or PRC-68B or any 6 meter transceiver, via the antenna BNC RF out connection to the RF in BNC connection on my PRC-352 amplifier and make my PRC-352 amp do double duty ?

And by the way, thanks to all you Brits who have been loyal allies to us since WW2.

Thanking you in advance, I remain,

Bob

Topic: 144 Message: 145

Bob,
No reason I can think of why you should'nt use your 20W amplifier with alternative driver sources: I've used one for several years to boost the output of an old Yaesu FT-726R on FM and it works just fine. The output of the amplifier is throttled back for battery economy to 20W, and can provide a bit more if internally adjusted (there is a regulated psu control inside that varies the PA finals supply), and in the case of the amplifier I'm using, it gives about 30W out for about 5W of drive.
The amplifier is'nt linear, just Class C, but works well on FM.
I've got a PRC-68A this end, will have to give it a try to see what output I get!

Good evening all.

Is there any reason that I cannot or should not hook up my PRC-77 or PRC-68B or any 6 meter transceiver, via the antenna BNC RF out connection to the RF in BNC connection on my PRC-352 amplifier and make my PRC-352 amp do double duty ?

And by the way, thanks to all you Brits who have been loyal allies to us since WW2.

Thanking you in advance, I remain,

Bob

Alan

If I remember rightly there is a DC connection from the amp to the 352 to allow sidetone to be muted in the test position - I suspect that may be an issue if used with radios that also have DC on the coax ? I will have a look for the schematic when I have more time to see what is actually there.

Welcome back to the UK btw - give me a call when you get over the jet-lag !

Regards

Iain

Bob,
No reason I can think of why you should'nt use your 20W amplifier with alternative driver sources: I've used one for several years to boost the output of an old Yaesu FT-726R on FM and it works just fine. The output of the amplifier is throttled back for battery economy to 20W, and can provide a bit more if internally adjusted (there is a regulated psu control inside that varies the PA finals supply), and in the case of the amplifier I'm using, it gives about 30W out for about 5W of drive.
The amplifier is'nt linear, just Class C, but works well on FM.
I've got a PRC-68A this end, will have to give it a try to see what output I get!

That would be the 1.2 m trailing wire antenna. We used it occasionally , usually if we knew we would be in and out of thick undergrowth a lot where even the short whip could get hung up but it didn't give you much of an advantage even then!

150. Connecting PRC351 to 20 W Amp

Yahoo group: Clansman351
Date: 2011-08-28 08:48:19 UTC
From: andymadge@btinternet.com
Topic: 150 Message: 150

I have a 351 to connect to the 20 W Amp but no actual connecting cable so I am going to have to make one from a spare length of issue coax.

I have a copy of the CES which gives the length of the cable as 24 inches and I have enough spare bnc connectors to put either a straight or a right angled connector on each end.

Can anyone tell me which type of connectors the cable had?

151. Clansman PRC-351 Handset issues

From: Jim
Topic: 151 Message: 151

Hi,
Yesterday I finally got to schedule a commo check with a guy from a local radio club to verify I can get a contact with my PRC351. During the test I found that I was getting a lot of static from the handset during receive and transmit. I was told that the handset may need cleaning. Would a handset go bad with the material built in the mouthpiece? Also is this possible to clean or repair the handset or just replace it? I still have the headset w/mic and didn't have it yesterday during the testing.

Thanks,
Jim KK4CWO

Hi Andy
I use right angle bnc plugs. I have an original Clansman cable but not sure if this exactly the right one. The right angle plugs ensure the cable output of the SURF and the amp input face the carrying frame and so neatly clip into the back of the frame. My 352 is the one on the picture on the homepage of this group.
Cheers

Hi Jim
This sounds like the hansset needs the microphone replacing or the cable is faulty.
This is a guess not having heard the radio myself. When set to then loud position you hear your self on the earpiece on transmit. Does it sound noisy to you?
Have you got someone closely to test? It might just have been a noisy signal. How far away was the other guy and what rig was he using and what antennae were used on each end? What frequency was used?
Cheers
Stewart

Right angles, but unless you are recreating the original configuration i.e the cable that clamps to the carrier plate, which had to be a precise length to fit, you can use an approx length and either straight or right angle connectors.

Stewart,
I did the test with another guy who had a PRC-68B and another Harris 138 radio and when talking or receiving a call it was very noisy. We were testing about 6 feet apart on 51 Mhz and even without the antenna on I got the same noise. We tested using all three radios and mine had noise on both loud and whisper mode. The 68 and 138 radios had a clean signal. Maybe I need another handset. I'll try more testing.

Thanks,
Jim kk4cwo

Hi Jim
If the other radios were fine then it does sound like your 351 is the issue.
I agree trying another handset first is the best way forward. The mechanical bits are always the most likely to fail :-)
cheers

Interesting that you have a hi-power line nearby...

I live above a bakery whioch uses a 450v 3-phase supply for it's ovens and had a similar noise problem on my display groups 351/352s.

When we did a display it could take two or three days for the noise to clear up although I found that the set linkled into the Ground Spike Antenna would clear quicker than the others.

We never did find out the technical reason but assumed some form of static was building up inside somewhere.

The sets now live at another members house and are fine.

Hi Paul,

I bought a very fine reprint of the Clansman PRC-351/2 User Handbook from
EBay Seller
http://myworld.ebay.com/vintagemvmanuals/&_trksid=p3984.m1439.l2754

It was $32 dlvd. to St. Louis, MO. in Jan of this year.

Is 76 pages and very complete.

Hope this helps.

Hi all
Check the Vmarsmanuals.co.uk website. It is there. I am not sure if you have to be a member or not. VMARS = Vintage Military Amateur Radio Society and it is based in the UK but has members worldwide.
Stop press .... I just checked and the Clansman manuals are there however you need to be a member. . At the price quoted below it might be worth becoming a member !

165. Bought another prc-351 set

Yahoo group: Clansman351

From: Jim
Topic: 165 Message: 165

Bought another PRC-351 set off ebay from gten98. Good price of $76 or49 pounds. It's similar to the earlier kit I bought from him as it came with light weight pack frame, rt-351 transceiver, 1.2 meter and short whip antenna, original manual and this time a 4amp battery. System works. Question I posted concerning reception was when transmitting and receiving on a channel there a good bit of static. I guess this is normal? Ok, so maybe I'm expecting signals to be crystal clear? When the weather clears and me and the wife aren't sick we'll do some comms checks.

Hi JIm
I assume you are on the squelch on positions on the switch that switches it on and off. There is a pulsing of noise like the squelch opening and closing when the battery starts to get low.
Cheers

I found you get quite a bit of rubbish in the amateur bands and once you have a decent antenna up and find a clear channel it goes away. And as Stewart says, the battery warning indicator is intermittent squelch noise until death

Get well soon...

Hi All,

Just thought a quick intro would be good, been interested in radios for most of my life, worked mainly with PMR and Marine Band - (Took the RAE many years back but missed it by 2%, took the novice 20 years later and passed - call M6FGP)

Over the years built up quite a collection of kit, mainly PMR and ex emergency services.

Quite a bit of kit at pres.

PRC351
VRC353
EVHF x2
GSA x 2
5.4m Masts x 4
Clarks PU12 x 1
DCCU
24V Supply (Widne Ash)

On the PMR conversion side

Tait T2000 Lowband (PMR Products conversion)For 4M)
Tait T2000 Highband (For 2m)
Icom F210 UHF (70cm)

And few other bits and bobs, gradually building it all into a working shack, will load pics when its all running.

Still thinking about more clansman kit, any suggestions.

Ian

A nice kit of gear !
my suggestions to "round out 2 your VHF kit (assuming you dont already have them), is th 20Wat ampliifier to turn your PRC351 into a PRC352. It is a good set up to use with the pineapple on your 5.4m mast(s).
if you want to be complete form a kit perspective, you might want the 4w SURF for the 351.
it is for collector purposes to have the whole kit, but to be honest it does not have any real use in the amateur world.
Maybe a diversion and get a PRC320 HF radio? You have most of the ancillaries already having the 351 and 353. Just watch where you buy it. There are some mighty heavy prices on a well known online aucton site that take your breathe away.
The important thing is to enjoy!
Also there is a sister site to this ne called Clansman Skeds and it is a good place to announce if you are going to be operatiional so other clansman users can listen out for you. I will pick your email address from the site and send you an invitation to the sked site
Cheers

Careful ian.

I started with 1 PRC320, now I have loads of green stuff and a
Landrover with more in, all within one year!

From: briangstrada
Topic: 12 Message: 171

Hi all,

Although I am a licenced operator at Intermediate Level I have never had any contact with military radios. As a result of visiting V.M.A.S Radio Weekend near Gatwick Airport recently and seen them operating I now have obtained a PRC 351 and PRC 320 radios. They seem to operate very well but there are limitations. 25khz spacing on the '351 and no Lower Sideband on the '320 but having said that they have performed well against the usual Japanese black boxes we normally use.

I have a DCCU for charging the batteries but need a suitable power supply, any ideas?

I look forward to contacting you all at some time soon.

Brian

There is a mains power supply available. Have a look through the chargers section and you will see a mains power unit made for the Clansman radio family. Inhale no affiliation it is just an example. I have no affiliation to this website.

From: Stewart Gebbie
Topic: 12 Message: 179

Hi Brian
In run an HF 320 always at home from a battery. In use the extension cable to connect the battery and charge the battery when needed. It has never been an issue. In use an old battery and charge it twice a week. In the original use in Land Rovers the radios were run and the battery float charged from a DCCU.
The 12 volt DCCU draws under six amps so a 10 amp 13.8 volt supply should domitnno problem. My recommendation is to keep one battery for this purpose as it will take a bit of a beating.
It's a lot cheaper than buying a Clansman mains power supply at £95 plus shipment costs.
Cheers

Mike,

The 13.8v would be input to the 14v DCCU then out to the battery, I feel you may have misunderstood my intentions.

To clarify. I charge the battery with the DCCU and switch off the DCCU. Then run the radio on the battery.
As Michael says never connect any thing other than a properly designed constant current charger designed for Charging Nicad batteries, with appropriate full charge cut outs.

Thats how I use mine, even though I posess the UK-AC1-2870 and have been doing since 1978 according to the user handbook.

BTW a collection of batteries is a good idea. They are dirt cheap (saw a palet of 600 plus coming onto the market this week). There was an auction at MOD-Sales showing two of the PSU's and accompanying DCCU - dunno if its gone by now.

Might bring the cost down, £140 to £175 is not uncommon for the PSU.

Explosion risk if charged with Lead Acid Batteries? Otherwise????

192. RE: [Clansman351] Re: Introduction

Yahoo group: Clansman351
Date: 2011-10-08 10:22:19 UTC
From: Robin Maddison
Topic: 12 Message: 192

Testing out my IBMS which came with the Landy on a known dud battery-18 hours now on COND, IBMS powered by 28v batt ,only float charged with 700mamp charger though, keeping an eye on it(the charger) behaving ok at the moment, should I anticipate trouble?

My 14v DCCU powered by 24amp Drae 13.5, no probs apart from hot DCCU. DCCU killed a 13,8 .4 amp CB charger! 6/8Amp got very hot but survived!

I am spending today charging 10 batteries. Using a DCCU and a specialist Ni Cad charger. I started with 12 and found two duds. One was a lithium which I obviously did not charge. It was exhausted.
Cheers
Stewart

Lol,

Well i already have the Landrover!! but not a FFR, So part way there though this is also my day to day vehicle so don't want to add to much more to it at present.

Will be looking at more bits of clansman equipment though, its deciding what to get next, HF is probably the next step, although as a foundation limited to 10 watts so will have to choose carefully.

Quite enjoy the old kit, its a challenge but also as i was trying to explain to a friend today, its far more interesting than program it up and away you go! so i tend to go for a mixture of the two.

Regards

Ian

201. IBMS (was RE: Introduction)

Yahoo group: Clansman351
Date: 2011-10-11 07:53:57 UTC
From: iain@moffatig.com
Topic: 12 Message: 201

Robin

Sorry for slow reply - in condition mode it will attempt up to 5 charge/discharge cycles - The IBMS detects full charge and total discharge based on voltage across the terminals so can be misled by very flat batteries (which it sees as short circuit) and ones with dead cells (which never reach its idea of full charge).

I have a healthy IBMS and it does this sometimes with batteries that will charge on a DCCU and slow charger plate or an ACCU.

Robin, Jim

I have a bag of the BNC to MB cables for the 350 somewhere - contact me off list as g0ozs@... if you need one - they never sold well on e-Bay so I will be happy to put one in a stamped, self addressed jiffy bag - postage needs to be for a packet because there is a plastic strain relief that won't go through the large letter hole in the Post Office size gauge

Regards

From: Andy Madge
Topic: 205 Message: 209

No but there is a BNC-N on the top which does.

The issue Ground Spike Antenna (GSA) contains a short (10-15 cm) cable to connect that socket to a standard BNC cable. GSA’s are quite cheap on Ebay and pretty much double the working range of the 350

210. Re: [Clansman351] Re: prc 350 radio

Yahoo group: Clansman351

Topic: 205 Message: 210

Good suggestion Andy. GSA antenna sell for around £10-£15 on EBay so they are not expensive. I have one and makes a huge difference when using with my 351 or 352. There is a kit to be able to use this antenna on a mast called, notnsurprisingly the elevation kit, in fact I am in the hunt for this elevation kit so I can put my GSA up on the 5.4 metre mast. I have all winter to find one so I can be ready for next summer!

213. UK Six Metre Band Plan

Yahoo group: Clansman351
Date: 2012-01-31 18:01:48 UTC
From: Stewart Gebbie
Topic: 213 Message: 213

Hi all
The new UK band plan on six metres has allocated 51.650 and 51.750 MHz for use on FM and this is excellent news. Now we don't need to mess up the old FM channels with our 351's. May I suggest. 650 as a preferred calling channel for us aficionados of proper radios for six metres :-)
Cheers
Stewart

216. My RT-350 died after high voltage by using nicad in dry-cell battery box

Yahoo group: Clansman351
Date: 2012-04-29 21:08:51 UTC
From: bradlington
Topic: 216 Message: 216

Hi

My RT-350 died shortly after placing charged nicad cells in the dry-cell battery box and the unloaded voltage was 19 V.(19/14 cells =1.357 each which is normal for semi-charged nicads)

Can anyone assist with the min-max volatge of this radio .

I used it for a few short test overs and then noticed it was dead.

Is this a common problem and I am in desperate need for the manuals and cct diagram to repair my trusty RT.

Any assistance would be appreciated .

regards

Well, the PRC350 is not 24v like the others.

It is designed, or was originally, for its own nicad pack - 18v as I recall.
The cell pack takes U11 cells at 1.5v

12 is it? so that gives 18v nominal with alkaline one time cells.

VMARS have all the info available

Hi
Thanks for the response.
The manual state 12 to 24 V so my 19 Volts should have been ok .
Only thing I can think of is that the radio was not used for about a year due to battery pack issues and today I went and got everything going - that was short lived.
I know that we had other radios in the LMR side which did similar things when the Tant Caps in the radio packed up after no use for a long period.
I have the manual they have on the VMARS site but would love to have a cct diagram to work with .
Regards
Bg

Yes, could be I don't have mine to hand to check!

Poorly designed battery cassette in any case, the Infantry found out the hard way that it fell to pieces in use, if one jumped down, from a wall for instance.

The small hole for the "pips", + side of the cells, don't always protrude through adequately to make contact.

Just fitted my cassette on 350 set, no problems, voltage was 18.9! So if you fill the cassette with alkaline batts then the voltage is 16 X 1.5 =24v? Manual says 12 to 21v OK.

Yes, could be I don't have mine to hand to check!

Poorly designed battery cassette in any case, the Infantry found out the hard way that it fell to pieces in use, if one jumped down, from a wall for instance.

The small hole for the "pips", + side of the cells, don't always protrude through adequately to make contact.

Well, the PRC350 is not 24v like the others.

It is designed, or was originally, for its own nicad pack - 18v as I recall.
The cell pack takes U11 cells at 1.5v

12 is it? so that gives 18v nominal with alkaline one time cells.

VMARS have all the info available

On 29/04/2012 22:08, bradlington wrote:

Hi

My RT-350 died shortly after placing charged nicad cells in the dry-cell battery box and the unloaded voltage was 19 V.(19/14 cells =1.357 each which is normal for semi-charged nicads)

Can anyone assist with the min-max volatge of this radio .

I used it for a few short test overs and then noticed it was dead.

Is this a common problem and I am in desperate need for the manuals and cct diagram to repair my trusty RT.

Any assistance would be appreciated .

regards

The 350 Battery Cassettes I have hold 14 cells. That won☐t exceed the 21v
even with primary cells at 1.5v each.

Just fitted my cassette on 350 set, no problems, voltage was 18.9! So if
you fill the cassette with alkaline batts then the voltage is 16 X 1.5 =24v?
Manual says 12 to 21v OK.

No problem Robin. I☐m pretty good at mistakes too ☐ and usually with the obvious bits of course!

I had been following the discussion without really applying too much thought ☐ the Paddington Bear problem I suppose ☐ but eventually the references to cell numbers and voltages broke through to the surface and I went and looked at a cassette.

Folks

I understand that the set worked for some time and then died permanently after using NiCads in a cassette ? Overvoltage would have killed it immediately and battery terminals would be intermittent in my experience. So this is likely an internal fault that happened by coincidence.

NiCads have lower per cell voltage (1.2V nominal, 1.4V charged and unused) than ordinary alkaline batteries (1.5V nominal) so the terminal voltage with a full load of NiCads should be lower than dry batteries and within what the set will tolerate. I think there may actually be a provision to use dummy cells in place of 2 batteries when using Dry cells in the cassette as the normal rivetted case rechargeable batteries for the 350 are nominally 14V (12 cells x 1.2v = 14.4v) whereas 12 x 1.5v dry cells would be 18V. I generally find 350 batteries charged on an IBMS to be 16V or higher before use. I haven't ever measured any recent NiMH cells - does anyone know if they are higher voltage when first charged than NiCads ?

I have had particular problems with the C-Cell cassettes not making contact with the 350 but I would have thought that a hard failure in the absence of mechanical disturbance is an electrical fault in the set ?

Regards

Iain

Hi All
Yes the dry cell case takes 14 of C cells.
I now have the full technical manual so will dive into it this weekend.
The dry cell I also battled to get contacts but then loosened each posative return screw slightly and it made contact .
From looking at the cct the obvious place is to start looking at the converter as there are some comparators there aswell in the switching on circuit .
I was very unhappy when it died as I really like my 350 .
I have two normal sealed battery packs but they are both US and will need to repack some time.
If anyone wants the manuals I can upload to the "Files" page.
Has anyone else had a similar fault - no use reinventing the wheel .
Regards

Jim,

Very tempting at 21.5 miles

A rebro positioned somewhere with LOS between you and it and me and it would be very useful.

Anyone out there between Gravesend and Croydon?

Anyone got a good path profile analysis software?

I'm fed up with listening to the silence too - so looking to establish a net - anyone?

73 de Stu - G4IYK

Subject: [Clansman351] 351 contacts

Wonder if anyone is fairly close to me (THORNTON HEATH) NR CROYDON..
have monitored the band for ages in the past with zero results..
perhaps a sked on the 351 to be arranged ??

Oh Dear. I have almost more chance of winning the lottery than have a contact on my 352. I am on the North Yorks coast so half my signal is only available to the few cod left in the North Sea.
Cheers

Stuart

Al G8LIT and I have discussed trying it in East Suffolk/North Essex - we are probably too far away for stations South of the Thames (although from my QTH I get good reports from Southend when reading GB2RS on 2m with about 70w so a 352 or 353 with an elevated antenna would likely have a chance to Gravesend or high ground S. of London without much of a lift). G8BLS is also local to here and has a 352.

On Sunday 6th May as GB2CRF Peter and I will monitor 51.75MHz on 6m FM and 70.475MHz on 4m FM and would welcome HF spots called in on those frequencies. I hope to have a EVHF and 353 on 6M and a EKGSA and 353 (with 352 as backup) on 4M.

Regards

Iain

How much space have you got?

The next logical question is do you own a Clansman Inverted Vee Antenna? These do well with an expected range of 100+Miles - its a half rhombic. Highly directional etc.

Never say die

Ah sorry I lost the thread for a bit but hey, yes, brilliant. I have a good take off into North Essex on 2m and hear stations as far up as Peterboro', Cambridge quite strong. The QTH here overlooks the Thames and Canvey and S'end are line of site as is Canary Wharf.

It will be interesting to get my EVHF elevated onto a new mast in the morning and test the 351/2 for a while. I see you are about fifty to sixty miles to the north of me and very little in the way of obstacles - depending on antenna height we might make it. I have never fully tested the setup on either 4 or 6m, nor do I have any directional antenna for 4 or 6. Just the EVHF so I agree it will be an interesting day with lots of possibilities. Will be listening out for contacts.

Thanks, look forward to it and if we don't make it there we can try something else.

Regards,

Stu

Its a clansman antenna kit. Green bag. A Single 12M Mast supports the wire at the centre and the feedpoint is at ground level at one end while the terminating resistor and a ground wire return complete the circuit running back from the far end - which is pointed in the required direction. You can find them on Ebay but you could also build one quite cheaply. It needs plenty of room but Hey does it go!

I have 3 of them - we have a fair bit of space - the limitation may be the number of 9m masts and time to put them up - there is certainly room enough for one of them - what is your locator square so I can aim it right (must remember a compass too !)

Sam (melchior962) on e-Bay has them in good used condition for £49 I think. They come in a rather large bag - not suitable for long walks at least 15KG I think with cables and anchor spikes.

The antenna comprises

1) a 50-to-300 ohm transformer for the driven end,
2) a 300 ohm load for the end facing the desired receiver,
3) about 30 metres of wire,
4) A ground return wire
5) an insulator to go at the top of a 9m mast half way between the ends.

It is supplied with 20m each of heavy and light coax, a C to BNC adaptor, and steel pegs to anchor the transformer and load units.

The inconvenience is needing one of the Racal telescopic masts rather than a 5.4M one man mast, but they are claimed to be the best DX VHF antenna of the Clansman range. I have plans to try them on 10m with switching for S, SW and W to get some DX on HF ...

As with any Rhombic some of the power ends up warming the load at the end, but the combination of Rhombic gain and resistive loss still ends up with significant overall gain. From memory the EMER claims 5 to 8 dB (more at higher frequency) but does not say whether it is dBi, dBd or dB relative to the patrol whip ! Given that the same VHF antennas technical description EMER gives ridiculous high gains for the GSA which is basically an end fed dipole (but the only resonant or nearly resonant one of the lot) I suspect it is dB relative to the patrol whip !

One of my Inverted-V bags is labelled "Rear Link" so I suspect that they were mainly used point to point between fixed sites and not for nets. Would that explain why you missed them ?

Thanks Iain for the detailed reply. I completely missed this antenna and while it is bulky, it does sound like the solution to me making contacts on my 352. The directionality will allow me to minimise the TX energy going across the North Sea and point it south where most of the other VMARS members are located. We should possibly make contact on 4 metres.
BTW there was some sporadic E on six metres yesterday. On my main
station I was listening to Slovenia yesterday afternoon on SSB. It was an east west event . No time to work anyone as I was working.
Cheers
Stewart G8YQN

So it is time to save up the pennies.

Brilliant JO01ek - this all sounds rather like a signals exercise;). I wonder if you shud set one up in the general direction between Croydon and here?

Catch up later. Work calls.

Regards,

Stu

>
> It will be interesting to get my EVHF elevated onto a new mast in the morning and test the 351/2 for a while. I see you are about fifty to sixty miles to the north of me and very little in the way of obstacles - depending on antenna height we might make it. I have never fully tested the setup on either 4 or 6m, nor do I have any directional antenna for 4 or 6. Just the EVHF so I agree it will be an interesting day with lots of possibilities. Will be listening out for contacts.

Stuart

OK I will do that - I think the 11m mast is already committed to a Pineapple and 7MHz dipoles for calling G8YQN on HF, but I have a Racal fibreglass 9m mast ex NCRS which will do. I think a bearing of 220 degrees from Ipswich will about split the difference between Croydon and Gravesend.

Mike

The EMER I have (the technical description one you sent me, as it happens) says that a Racal 11m mast should be used with top and bottom sections retracted to get 9m so that is clearly the optimum height. I expect (but cannot prove short of learning to use antenna modelling software - any NEC experts on here ?) that the height is chosen to maximise low angle radiation. Probably if you had a taller mast you would need more wire to keep the radiating elements at the same angle to the ground, and the supplied length is "just long enough" to work at 30MHz.

Regards

Iain

I can hear DTW in Ashstead and possibly bursts of Jim , from aircraft reflections, but so short and not readable really! Trouble is I never know what the bloody weather is doing, yesterday on Gibbet Hill It got cold as the cloud lowered! But I will go up there when the Sun comes out, I don☐t have so much trouble with RF since I earthed absolutely everything to the Dexion!

Yahoo group: Clansman351
Date: 2012-05-03 18:35:46 UTC
From: Jim
Topic: 251 Message: 262

Hello,
I've also run into a problem with making contacts with anyone my PRC-351 on FM from the Washington DC area. I know range is limited and even with a 6-meter dipole all I'm getting is static. Any suggestions on what's to improve reception?

Jim, KK4CWO

Hi Jim,
Had my first contact using the 351 today thats after trying for about 3 months with G6DTW who was 11 miles from me, not on the whip aerial of course but using tribander on my roof.....do not really know what to suggest to you ..but i did buy 2 Lucky Rabbits feet on ebay recently.....
regards Jim G4REK

Subject: [Clansman351] Re: HISS...HISS

Hello,
I've also run into a problem with making contacts with anyone my PRC-351 on FM from the Washington DC area. I know range is limited and even with a 6-meter dipole all I'm getting is static. Any suggestions on what's to improve reception?

Jim, KK4CWO

Iain, Peter and co,

Magic, thanks this should be very interesting. I wonder if you will have space and time to be able to point the inverted vee on different headings at different times? I know there are plenty of people like Stewart, Robin and Jim who would love the opportunity of a contact under such circumstances. Its certainly been a long while since I've done any of this sort of planning and it sounds like fun. I wonder if the 11 meter mast you refer to is the Clark 12m mast?

Regards,

Stu - G4IYK

Subject: Re: {Disarmed} Re: [Clansman351] 351 contacts

Stuart

OK I will do that - I think the 11m mast is already committed to a
Pineapple and 7MHz dipoles for calling G8YQN on HF, but I have a Racal
fibreglass 9m mast ex NCRS which will do. I think a bearing of 220 degrees
from Ipswich will about split the difference between Croydon and Gravesend.

RobinM G0GNE

On 2 May 2012, at 21:23, "Stuart Dixon" <dixx@reasignals.net> wrote:

Ah sorry I lost the thread for a bit but hey, yes, brilliant. I have a good take off into North Essex on 2m and hear stations as far up as Peterboro', Cambridge quite strong. The QTH here overlooks the Thames and Canvey and S'end are line of site as is Canary Wharf.

It will be interesting to get my EVHF elevated onto a new mast in the morning and test the 351/2 for a while. I see you are about fifty to sixty miles to the north of me and very little in the way of obstacles - depending on antenna height we might make it. I have never fully tested the setup on either 4 or 6m, nor do I have any directional antenna for 4 or 6. Just the EVHF so I agree it will be an interesting day with lots of possibilities. Will be listening out for contacts.

Thanks, look forward to it and if we don't make it there we can try something else.

Regards,

Stu

Subject: Re: {Disarmed} Re: [Clansman351] 351 contacts

Stuart

Al G8LIT and I have discussed trying it in East Suffolk/North Essex - we
are probably too far away for stations South of the Thames (although from
my QTH I get good reports from Southend when reading GB2RS on 2m with about
70w so a 352 or 353 with an elevated antenna would likely have a chance to

Gravesend or high ground S. of London without much of a lift). G8BLS is also local to here and has a 352.

On Sunday 6th May as GB2CRF Peter and I will monitor 51.75MHz on 6m FM and 70.475MHz on 4m FM and would welcome HF spots called in on those frequencies. I hope to have a EVHF and 353 on 6M and a EKGSA and 353 (with 352 as backup) on 4M.

I can hear DTW in Ashstead and possibly bursts of Jim , from aircraft reflections, but so short and not readable really! Trouble is I never know what the bloody weather is doing, yesterday on Gibbet Hill It got cold as the cloud lowered! But I will go up there when the Sun comes out, I don’t have so much trouble with RF since I earthed absolutely everything to the Dexion!

For manuals and schematics of a large number of vintage radio gear including Clansman sets, you should look through this list. The 350 user manual, I know is there.
VMARS= Vintage Military amateur Radio Society and is based in the UK with members worldwide.
Here is the link to all available manuals, schematics, servicing dats, etc
http://www.vmarsmanuals.co.uk/archive/files_index.

I don't have a 350 myself because the 351 and 352 are more useful in the UK as they cover the 50MHz and 70Mhz bands.
The standard rechargeable battery for the PRC350 is 14.4 volts and the Lithium one time use battery is a nominal battery volts here is 15 volts.
These radios are modular in construction so it is highly likely you have damaged the power supply module. I have seen these for sale on EBay.
Cheers

Emanuele

You just need a BNC to C type adapter and some cable. The antenna is an unbalanced sleeve dipole with the top half cut for something near 50MHz and the bottom half for somewhere near 70MHz. The "pineapple" matching unit is entirely passive. See:

http://www.g0ozs.org/clansman/EVHF/index.shtml

Because it is inherently lossy (having an attenuator to reduce reverse power on frequencies where it is badly mismatched, so the reflected power is 4dB down on what it otherwise would be) the EVHF is unlikely to outperform a 2m rod and TUUAM/Initiate setup or a resonant antenna for the band in use unless it is high enough to compensate for the 2dB loss in the attenuator and any mismatch at the frequency in use. The EVHF is more about being able to operate across the entire 30 to 80MHz range with instant frequency changes than efficiency I think.

I would be very interested to hear from anyone who was around during the transition from Larkspur (which had an adjustable elevated VHF vertical set to the correct length for the intended operating frequency) and Clansman whether the EVHF was an improvement in RF performance with similar RF power over similar paths (although better RX sensitivity on the Clansman sets may have made up for it?).

Regards

From: jim
Topic: 275 Message: 275

Hi,
The last 2 clansmam batteries i rebuilt i did not bother to include the diodes, just take them down to about 22 volts and put on charge for a couple of hours..if case gets warm to the touch take off charge...one needs to be around in case its over done.....as a bye
Maplins are doing a infa red thermometer that you just point at a object and it tells you the temperature...these are currently on sale at half price..bought one excellent...

Hi Jim,
I will be listening on 52.525 with my 351. Can't wait to make a QSO with my 351!!

279. Modification to 10 metres

Yahoo group: Clansman351
Date: 2012-06-16 10:52:53 UTC
From: Stewart Gebbie
Topic: 279 Message: 279

On eBay item number 230798244164 is a
VRC353 and the seller is offering to modify it for 29.6 MHz operation.
He is charging £25 so it cannot be a complex modification. Anyone any ideas on how it can be done. I would like to do this mod on the 351. It adds a toggle switch.
Cheers
Stewart G8YQN

From: de_kc5mo
Topic: 284 Message: 284

Hey all,
I have a VRC-353 that is not working above 40.975. In the synthesizer test the meter is in the red from 50 to 70.975 MHz. I have 24V to the radio and the ARFAT and cables connected to a dummy load. I turned the set on and let it sit for 40 seconds and tried to set it to 52.525 and it just flashes the display lamps. 30 to 40.975 it tunes up and you can hear the motors working, but 50.000 and up there isn't anything. This is my first 353 so before I open it up is there anything that I need to watch out for other than voltage?

Thanks
Herb KC5MO

Hi there
I am not familiar with this issue on the 353 however it sounds very much like a fault that develops on the RT320 radios. The symptom seen on these radios is that they will not tune to the higher frequencies. The cause is that the varactor diode on the synth board which is used to do the tuning is supplied by something like up to 110-120 volts. When this supply has partially failed then the volts drops. the result is then you cannot tune to the higher frequencies.
This fualt you have sounds similar. My own expereince is that the radios are bomb proof but the power supplies are usually where the fault occurs.
I hope this gives you at least an idea on where to start. Do a google on VMARS manuals and they might have a manual you can down load on te understanding that it is for your use only and not for publishing on the web.
Cheers

Hi Herb

the 353 has 3 bands with their own modules for Tx and Rx - sounds like band 2 needs a bit of a "tweak" either on the Tx or Rx turrets (or both) - try selecting 70MHz and if it works on that frequency, this will confirm that

email me direct and I can talk you through potentail things you can try

Thanks for all the replies. I have done some more testing and found that 50 and up just blinks the dial lamp and the synth test doesn't move the needle. At first 30 - 40.975 worked fine, but now the synth locks on, but when PTT is pressed it blinks and when tuning the TUAAM he TX lamp doesn't light. Also noted is that originally the current draw was 3A RX and it is now 1A. I am waiting instructions from the seller before I open it up.
I am checking into VMARS for some good reading material and a membership. It will be valuable for my other Clansman radios.

If you set the switch to "AFC Tx", have a look to see if the meter reads off the scale on one side or the other and as you turn down the frequency it should come in central enough to Tx properly

If this is the case you can easily tweak down the capacitor on the Tx turret to bring it into alignment

But I guess if you can just get a replacement from the seller that would be an easier option!

Hey all,
Here is an update as to my progress. I found the RX turret not working because of its position relative to the contact switch. I got that working by pushing in the switch and releasing it when the turret started to spin. That fixed the issue with the VCO not locking on all bands.
Next I got some good instructions from Steve on adjusting the trimmers and I now have band 3 (56 -75.975) working nicely. The AFC is right in the center of the meter on each end of the band.
Bands 1 and 2 are being a little more difficult, but I will spend a little more time on them.
I would like to see a nice Lucite case for this rig so myself and others can see the radio in action. It's really very cool!! Kind of reminds me of the carbon paper copiers we had in school.

Thanks for all the help
Herb KC5MO

Lucite is a strong clear plastic (probably a brand name). It was purchased as a refurbished. unit and it looks great. The only thing harder on equipment than combat is shipping them. I also have uploaded some photos of the inside of band 2 on the TX turret.

292. Low TX output

Yahoo group: Clansman351
Date: 2012-07-09 07:28:12 UTC
From: Sunny
Topic: 292 Message: 292

Recently bought a 351 thinking everything was ok, but after further testing, found that it wasn't giving the full rf out, if any. So what I am hearing on an external receiver is coming from the pre drive.

All the tests listed in the book, hiss, side tone etc are ok, battery volts ok.

Are they prone to the Pa's blowing, seems to be worse lower the frequency it goes, has anyone replaced the pa and what type was it.

Thanks

Hi

Thanks for the replys, the output is put into a 50 ohm load [Marconi power meter] the field strength meter doesn't pick anything up and the frequency counter with a small antenna struggles to lock onto the lower end of the band on the set ie 50 down to 30. The counter [10hz to 600 MHz type] locks onto the 4 mtr signa, but still only I assume milliwats of power.
Maybe it need to be tuned up again or it is the pa, not opened one up before so not really knowing what to expect.

Thanks

Steve who is in this group would be the most likely guy to know.
Although I think it would be a hard complex mod. The VMARS group use 50.7 Mhz as a calling frequency.
Anyone else got thoughts on this?
Cheers

Indeed. The AMM352 amp is perfect for a radio with 4 watts out on 4 metres. 20 watts out on 4 metres and of course you tunrn your 351 into a 352.
Cheers

Subject: Re: [Clansman351] Re: 351 20 watt amp

Steve who is in this group would be the most likely guy to know.
Although I think it would be a hard complex mod. The VMARS group use 50.7 Mhz as a calling frequency.
Anyone else got thoughts on this?
Cheers

Could be 160hz tone to open squelch of US sets and for rebro purposes between clansman . If heard through the distant station Civvy rig that's normal. Gets removed incoming by clansman sets normally. Can be turned off internally.

From: Stewart Gebbie
Topic: 305 Message: 308

I agree with Robin. The tone can be turned down as there is a tone level adjustment pot, so rather than modify the radio, you just tuen the level right down. It is accessibel when you take a 351 out of its case. I had pictures showing where the pot is, but I cannot find them !! The 353 must have the same way to make the adjustment. Now that is annoying me that I have lost these instructions...

Surely if it is your group you are free to moderate it in any way you see fit. Anyone not content with how the group is run always has the option of either going elsewhere or starting a group of their own!

Stick with it...

313. Making a 351 (352) Work down to 29Mhz

Yahoo group: Clansman351
Date: 2012-07-25 12:50:44 UTC
From: Stewart Gebbie
Topic: 313 Message: 313

On a different topic, I have found a modification online that makes a 351 work down to 29Mhz. Now this means the 351 can not only work 4 metres, 6 metres but also on 10 metres. A switch is added to the radio and mt guess is that this switch creates an offset on the synthesiser because to operate on 19.6Mhz you need to set the dials to 39.6Mhz.
The switch has a normal position and a -10Mhz position.
It wont work below 29Mhz on a standard radio without further modification.
Anyone any details of this modification?
Cheers
Stewart

My guess is that there are 2 out of the membership of 52, who are unhappy.
Leave well alone for the good of all who are happy!

Not a high percentage!

Out of interest there should always be more than one moderator so that
in the event of a problem somebody can take over, not leaving the group
in the air, as has happened elsewhere.

I think this thread should be entitled no new moderator required.

There is nothing wrong with the old one.

If it ain't broke don't fix it. Your talents are required in the community, thank you.

Best wishes,

Stu

Hi thereThe paint on Ebay is made by a company in Hull. Their website is www.paintsrus.co.uk (cut and pase to your browser)The official colour scheme is BS381C. This is a general specification for miltary colours including all the admiraty colours. I had a rifle through the options and there are bout 10 different greens and of cours it shows you them on your pc which is useless for matching. My thought was to trwal the web and find the Pantoen colour equivalent to this colour and then it might then provide an alternive to say going to B and Q and getting the colour mixed to the Pantone shade.I did buy this paint from this Hull company in an aerosol and it is a perfect match. It is satin finish. I did one of 320's with it and it looks like new.Hope this helps CheersStewart

Strictly speaking, of course, it is a two part paint for the Clansman
radio - tougher than ordinary paint.
Somebody will no doubt give us the part number
I doubt it it was ever in spray cans, for this reason.

But it probably doesnt matter now!

Hi Alan,
Normally get all my car thinners /paints from Stockwell Motors, not sure if they would match a sample if shown them....generally want the paint code from car but will ring them to see what they say..had hundreds of pounds off me over the years when i had the shop so might help me.

Hi there
The paint on Ebay is made by a company in Hull. Their website is www.paintsrus.co.uk
(cut and pase to your browser)
The official colour scheme is BS381C. This is a general specification for miltary colours including all the admiraty colours. I had a rifle through the options and there are bout 10 different greens and of cours it shows you them on your pc which is useless for matching.
My thought was to trwal the web and find the Pantoen colour equivalent to this colour and then it might then provide an alternive to say going to B and Q and getting the colour mixed to the Pantone shade.
I did buy this paint from this Hull company in an aerosol and it is a perfect match. It is satin finish. I did one of 320's with it and it looks like new.
Hope this helps
Cheers
Stewart

331. PRC-351 antenna test

Yahoo group: Clansman351
Date: 2012-07-27 11:18:41 UTC
From: de_kc5mo
Topic: 331 Message: 331

Hey all,
I decided to test the battle whip and the sectional whip to see which one worked better. I had a test set 100 feet (30.5 meters) away and tested each antenna with the SURF unit tuned to max meter reading and the frequency was 52.525 Mhz. I took several readings and averaged them out. Here is what I found.

Battle whip: -24dB

Sectional whip: -22dB

The sectional whip is -2dB better than the battle whip. Keep in mond this was a quick crude test just for fun, but the results are interesting.

It would be good to know what the measuring instrument was.We also have the 70 Mhz amateur band and it wouls be interesting to know what the results are on this band. If we know what instrument you used we could do the same type of test here on 70 Mhz.My guess is that the same result will appear. I am surpised how good the battle whip is considering how it is ie about an 1/8 wavelength at 6 metres.CheersStewart

From: John
Topic: 331 Message: 334

There is a loading coil in the base moulding of the flexible whip - about 10 turns on a 9mm diameter nylon rod. It is closewound and i.r.o. 24swg.

I'm being rather vague as the one I have on the bench is damaged and difficult to measure accurately.

Hi Stewart,
I was using a HP-8920B with a 1 meter long antenna which is all I had at the time. Just remember that I had the SURF unit in the mix. I will give it a try without the SURF soon.

336. Mod for Clansman inverted V to U.S. poles

Yahoo group: Clansman351
Date: 2012-07-27 22:23:03 UTC
From: de_kc5mo
Topic: 336 Message: 336

Hey all,
I posted some pictures of my modification for the Clansman inverted V antenna under (U.S. tent pole mod for antenna). I have tons of the U.S. tent poles and wanted to be able to use them with m inverted V antenna, but the mast cap is too small to work with the poles. I had a friend machine a bushing that slips into the ten pole then the mast cap slips into the bushing. Works and looks great. Let me know what you think.

I was talking to someone today about purchasing a 350 and they said they are not that popular to buy and not very reliable. The person was directing towards a 352 as more bang for my buck. Any thoughts?

So its VHF...The only difference between the 351 and the 352 is the 20 watt amp. The 351 is four watts. You can buy the amps separately as long as supplies last. Shipping the rechargeable batteries to the USA is a challenge and it is better to get an empty case and fill it. I would suggest buying a complete kit as it will be cheaper to ship. The 350 is low power with a 12 volt battery (comes with an empty case that takes C size batteries) and all the other popular radios that are portable use a 24 volt pack. They last forever when charged. Make sure you get the flexible whip as it works better than the rod antenna. The flexible whip is usually called the battle whip. You can buy modern chargers for the 24 volt batteries or you can get a 12 volt DC input original charger. Its called a DCCU. They are expensive though for what they are as most of the chargers were for 24 volt vehicles.
Hope this helps
Cheers

From: Stewart Gebbie
Topic: 353 Message: 355

There has been a mod developed for the VRC353. It is not published as yet. A similar mod should be possible on the 351 too.
I dont want to say who has done it as it one guy's intellectual property at this point. I believe the mod is going to be published on the web. I or the person developing the mod will advise when it is ready.
It will be worth looking at the VRC353 mod as you will see the scope of what is needed to do it.
Cheers

The DCCU is best bolted or at least sat on a large piece of metal. They draw 5 Amps approx from a 13.8 volt supply and they make lovely hand warmers in the winter!
Cheers
Stewart G8YQN

359. Re: [Clansman351] Re: re heat build up on 14 volt dccu charger

Yahoo group: Clansman351

Topic: 357 Message: 359

You are correct Stuart but this is better than standing or bolting it to the wifes car.....
  joking aside this is neater than looking for a large junk of metal to place on my Sherlock Holmes desk.
       In the past before the heatsink mod and without any forced air blowing on it the case has got so hot i could not touch it and still it did not fail.....
           regards jim

Topic: 361 Message: 363

Hi Cliff
First of all welcome to the group.
To be honest I would test the radio out and see tips it is working ok. If all seems well, I would advise don't fix what is not broken.
Did you get a SURF.? If so, make sure it's tuned or you will think your radio is totally deaf. I would advise leaving out of circuit

Hi Stewart,

Thanks for the welcome.

Yes, it is coming with a SURF, 20w amp and 351, so you recommend leaving the SURF out, does it attenuate the signals that much?

Hi Cliff
The biggest issue is that if is not tuned accurately the attenuation is huge. Me being a bit forgetful will move from 6 metresntom4 metres and forget to uptime the Surf and then wonder why I can hear nowt !!!
Cheers

Hi again Stewart,

Got you, so the key is change band reset SURF (note to self..... LOL)

Thanks for the tip.

369. Remote handset

Yahoo group: Clansman351
Date: 2012-11-10 19:40:56 UTC
From: Robert Newberry
Topic: 369 Message: 369

Anyone know how that remote handset works. I'm going to get one, but I'm wondering if its DC controlled?

Be interesting to know if it could affect be modded to work with something else depending on how control is done.

370. Re: Remote handset

Yahoo group: Clansman351

From: station_rs211013
Topic: 369 Message: 370

Hi

There is some info in the manual; it advises up 3km of D10 cable with no visible external power source so I would guess that it is powered by the 24v battery on the unit.

Modded to work with?

Well its only two wires. I gotta figure it must work like a DC remote.

OK I guess I'll have to wait until I get a handset. I still don't
understand how two wires can function as PTT, ground, receive audio and mic
hi.

It works like a telephone D10 cable spec:

NATO STOCK NUMBER : 6145-99-648-0813
CONSTRUCTION 7/0.28MM Conductor, 4 Copper wires,3 Galvanised Steel wires Centre strand copper, outer alternate strands of copper and galvanised steel

c

381. : Remote handset

Yahoo group: Clansman351
Date: 2012-11-10 22:00:20 UTC
From: kjwhite301@talktalk.net
Topic: 369 Message: 381

Try to think of it a telephone (BT type) The power, the ring power the earphone and mike plus dialling tones all go down the two wires to the exchange (all magic!)
Regards
Keith
Ps
never let out that magic smoke

OK I guess I'll have to wait until I get a handset. I still don't understand how two wires can function as PTT, ground, receive audio and mic hi.

Dear All

The way to think about the Clansman remote is that the microphone, earphone and call switch are connected in parallel across the pair of wires. The earphone has a high DC resistance, the microphone a medium DC resistance and and the call switch a low resistance. So the DC current drawn from the radio over the D10 pair tells the radio what the handset is doing. From the RT321 EMER H592 part 1 paras 175 onwards the currents required are

Less than 4ma - Set is in receive and audio is output to the D10 cable 4 to 8 ma - Set is in transmit and audio is received from the D10 cable More than 15ma - Call tone is produced by the radio (radio limits s/c current to 30 ma) Reverse polarity - Call tone is produced by a radio

It isn't like a modern telephone in that you can't speak and listen at the same time (that requires a transformer circuit called a "Hybrid" or an equivalent op amp circuit). The side tone heard in remote or intercom mode is produced locally in the handset by the microphone being in parallel with the earphone. The radio switches the audio path between TX and RX based on the DC current.

Hope this helps

385. Battery Box Size

Yahoo group: Clansman351
Date: 2012-11-11 11:47:18 UTC
From: station_rs211013
Topic: 385 Message: 385

I've done a search but can find the answer; can anyone tell me what the internal size of the 4Ah battery box is please. I have the idea of putting 2x 12v 5Ah SLA's in series but need to find the maximum size that will fit in side only I don't have an original one to strip down yet.

Cliff

180 x 68 x 120mm inside the box. The usable space is less because the charge connector and battery terminals project inside - so more like 160 x 68 x 120 usable space or 180 x 68 x 110 if you remove the charge conector which otherwise projects about 2 cm inside.

Looking at the Maplin Catalogue a pair of the 2.1AH should fit (but cost more than a NOS Clansman Ni-Cad)

XG74R 12V 2.1Ah 178x66x34 mm 0.83 KG

The 2.8AH are too big

XG75S 12V 2.8Ah 134x64x68 mm 1.1 KG

(But I think one of them and a 12 to 24V inverter might be cheaper than 2 batteries !)

Hope this helps

Iain
73 de G0OZS

PS to all - has anyone found a solvent that gets rid of the foam packing inside the cases without taking the lid as well ? I need to find a better way to clean the terminals than tweezers !

Hi Iain,

Thanks for the info, much appreciated.

I was looking at the Ritar RT 1245/50/55's they are 90x70x107 so may be a tad too big or maybe "Jerry-build" a battery pack with some gaffer tape and batter clips welded on the sides with JB weld and painted a suitable colour.....

What do you reckon doable or not?

388. Reminder on Posting Manuals on the Yahoo group

Yahoo group: Clansman351
Date: 2012-11-11 14:07:12 UTC
From: Stewart Gebbie
Topic: 388 Message: 388

Hi all
I have deleted the 351 Manual that was posted on this group as it was dated May 1977.
The reason for deletion is that this document is still Crown copyright until 2026.
The MOD has allowed the release odf Clansman documents to VMARS members on the understanding that they are used by members in the course of their hobby on the understanding they are not re- distributed.
Thanks for your understanding

Cliff

The cases are surprisingly soft and would likely bulge enough to get the 70mm dimension in - I think one and a 12v/24v converter would fit, The other approach if only operating in a vehicle or fixed location is to make up a separate larger pack with a cable and fit a socket on the side of the original pack so it is really just a converter from the radio power connector to something more convenient. I have plans to do this with some dead 1ah packs (i have 12v packs in ammo boxes for /p operation).

The other thing to consider in either case is fusing - the Ni-Cads weren't fused (although the wires to the battery terminals were surprisingly thin so might well have failed first in case of short circuit) the later lithium packs were fused at 10A and I think it would be wise to do the same for the Lead Acid cells with high s/c current

Yahoo group: Clansman351
Date: 2012-11-11 14:45:40 UTC
From: station_rs211013
Topic: 385 Message: 390

Hi Iain,

All points duly noted. Not sure about the 12v/24v converter though simply because on the 'bay Ritar RT 1250 can be got for about £16.50 each inc P&P and the weight difference for the two isn't that much from 1 original battery and the converter is about £25 +/-

Once I have my kit I'll ponder some more.....

Your decision is respected although the PDF manual is freely available elsewhere on the web and didn't take too much hunting down, hence the PDF file I have.

I personally would be more wary of the "first generation copies" available for purchase as this is an absolute breach of copyright.

394. Re: Battery Box Size

Yahoo group: Clansman351
Date: 2012-11-11 15:14:19 UTC
From: station_rs211013
Topic: 385 Message: 394

On the subject of protection the manual advises:

Input Power (max.)20V to 32V
Transmitter (PRC-351)22W at 24V (900 mA max.)
Receiver3W at 24V (130 mA max.)
Transmitter (PRC-352)65W at 24V (2.8A max.)

I would think an in-line 5A would be more suitable rather than 10A as that is still pretty high as the TX only draws 2.8A at 65W on the 352.

I have plans to do this with some dead 1ah packs (i have 12v packs in ammo boxes for /p operation).
>
> The other thing to consider in either case is fusing - the Ni-Cads weren't fused (although the wires to the battery terminals were surprisingly thin so might well have failed first in case of short circuit) the later lithium packs were fused at 10A and I think it would be wise to do the same for the Lead Acid cells with high s/c current

Topic: 369 Message: 395

Thank you Ian. That is what I suspected, although I think I was frustrating people because I was getting replies stating its powered by the battery.

Maybe I wasn't stating my question clear enough. Your reply answered my question perfectly.

Hi Robert,

Sorry, it was a misunderstanding on my part in your question. I read it as as "how does the remote handset work?" rather than "what are the technicalities of how the handset actually works?"

Wayhey! it's arrived!!!

It's like brand new!

Got an intermittent hiss on power-up so looks like the first thing I got to do is charge the battery and get me some power sorted.

Can't wait.....

You will probably also find it has 351 on it not 532!
Yes that is what a flat battery tells you!

Mike

400. Re: Battery Box Size

Yahoo group: Clansman351
Date: 2012-11-13 10:09:11 UTC
From: station_rs211013
Topic: 385 Message: 400

Just poking around on the interweb and my older emails looking for references to batteries/PSU's and stuff and found a post referring to a IMAX B8+ charger/reconditioner, has anyone had experience of these chargers?

I have plans to do this with some dead 1ah packs (i have 12v packs in ammo boxes for /p operation).
> >

401. Re: My PRC-532 on its way!

Yahoo group: Clansman351
Date: 2012-11-13 11:50:43 UTC
From: slack5874
Topic: 361 Message: 401

A regular on/off mush indicates low battery on the 349, not (as far as I am aware) on the 351/2... (Happy to be corrected of course)

I have an odd situation with intermitent hiss on some (not all) of my PRC-350's - while around my house or in my garden, it is there and very annoying, but if I go elsewhere (i.e. in a field somewhere) the radio is fine. It's as if I'm getting some kind of interference from something in mine or my neighbour's house.. But its the same across all frequencies, which is odd..

And it never happens on my 351's or on my 353, which again has me scratching my head

Anyone else got this problem?

Hi Steve,

The intermittent hiss on the 351/2 is indicative of the battery dying, confirmed by both users and the manual :-)

Your problem does seem to point to QRM have you tried any other radios on the same freq's (thinking perhaps try a airband RX with the Ant disconnected....)

403. Fitting FFK's

Yahoo group: Clansman351

From: station_rs211013
Topic: 403 Message: 403

Has anyone fitted more FFK's (Finger Friendly Knobs) to these units as they seem to get a bit harsh after a while.

The std ones are obviously made to set the freq and be left alone but when "flicking" through the channels they get a bit vicious on the finger tips.

Cliff

I understand the problem ! What I have heard of and I intend to do myself is to make a kind of box spanner to fit over the knobs with a larger handle at the other end

Regards

They are a nightmare!!!!

I was thinking along the lines of attaching some control knobs acting as extensions on the original ones but not sure if the extend too far out, I've emailed the supplier of these (http://www.ebay.co.uk/itm/300815081277?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1438.l2649) to see how far they protrude.

I'm lucky enough to have brought a refurb kit that has a spare set of original knobs etc. but I'll leave the other side as is so only altering the freq and on/off switch.

I'll post some more pictures in my album as I make changes.

Hi Cliff,

You might be able to mould an extension with polymorph – I think this will work quite well as the original has an indentation and four protruding lugs which if you mould the soft plastic into shape should form quite a nice key. This will also preserve the channel numbers which you would miss if you used the guitar knobs...You'd only need one to use a sort of key.

Regards,

Stu

They are a nightmare!!!!

I was thinking along the lines of attaching some control knobs acting as extensions on the original ones but not sure if the extend too far out, I've emailed the supplier of these (http://www.ebay.co.uk/itm/300815081277?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1438.l2649) to see how far they protrude.

I'm lucky enough to have brought a refurb kit that has a spare set of original knobs etc. but I'll leave the other side as is so only altering the freq and on/off switch.

I'll post some more pictures in my album as I make changes.

Hi Stu,

You may have a point, I'd envisaged super-gluing these knobs on top of the originals thus keeping the numbers visible and aligning the indicator line on 0 but it depended on how far they protruded, hence the email to the supplier to see how "tall" there are. I'll look at the polymorph idea though, cheers.

This will also preserve the channel numbers which you would miss if you used the guitar knobs...Youâ□□d only need one to use a sort of key.

REME technicians had the use of a hand held metal devise that located onto the knobs, as they also had the sore finger problem moving the knobs all day and every day.

Tis done! See photos.

I found some knobs that are exactly the right size for the job and simply super-glued them in to place. They are 2/3 mm proud of the protective switch fins but I doubt that this will cause a problem in civvy life; the radio still fits in the 58 patten rucksack ok - and so much easier on the fingers. :-) I have left the switch on the right hand side as is.

If you want supplier here they are [1510BK] Black Davies 1510 Style
Knob from: http://shop.pedalparts.co.uk/Knobs/cat847125_1282463.aspx

Iain
Thank for you tutorial on the remote hand set I had often wondered how they worked.
I suppose that the larkspur were the same I had made three up from telephone handset found in the streets of Belfast when there had been a "bit of a do" there back in the dark days They were in short supply (remote handset) then, or the store men wouldn't hand them out. I found out that if they were wired wrong there was no sidetone which was ok once you got used to not hearing yourself When I eventually saw my error and put that right I found that if I ran a spare wire from wrong side down the curly GPO lead you could connect a loudspeaker which gave more volume in the ops room or in the FFR land rover so headphone need not be worn and with no sidetone on the loudspeaker there was no feedback which the other sigs ops had when they just plugged a wire from a speaker into the audio sockets on the radio J1 box or the remote terminal. Later on I put a small amp in the body of the desk telephone with a small speaker were the dial went and used the switch above the dial/speaker as the tone call, (real posh)
Thanks again

Keith
PS
I used that set up till I moved on from the signals platoon :

With the switch to LOCAL there is a fairly hefty audio signal from those terminals but also about 18v which makes me worry about plugging it into civvy stuff willy-nilly(if I measured it right)

From: jim
Topic: 413 Message: 413

Hi all,
There is a few Clansman radios that are supposed to be waterproof to a depth of about 2 meters if my memory serves me correct.....
how on earth do they get a seal on the rotary control spindles ??
a couple of Clansman sets are actually pressurised to some degree after sealing.....perhaps i am missing something...

Hello,

I'm new to the group and have just received two PRC-352. These are neat radios! One of mine works well enough to use for monitoring some 6 meter activity.

I'd like to add an external speaker and a search brought up this thread.

Keith, would you elaborate on how the external speaker was attached to the remote terminals? I take it the two leads do not simply attach to the two remote terminals. Sorry I didn't follow the 'wrong side' terminal comment and "wire down the GPO lead" comments.

I have rewired a military LS-454 speaker (with transformer) for use with Clansman audio plug and it works great on my PRC-320. However, when plugged in to the PRC-351, the volume is poor. The headset is actually louder than the speaker!

Thanks,

Bob WB4ETT

Hi Jim,

I have seen references to the Clansman kit be "waterproof" and that the 320 can be submersed up to 2 metres for 2 hrs but I've yet to find a definitive explanation as to what is means by waterproof.

I would think that the PRC kit should be able to with stand rain at the very least!

Hi,
Yes agree, bit of rain perhaps .....we do get that on occasions over here.....got a 320...321....349...350 353

wont be testing in the pond though....especially the 320 what a complicated radio..think it could have been made much simpler, lots seem to be failing.

Interesting wot you say – lots of 320s seem to be failing. Bathtub curve of failure – kicked in big time towards the end of life with Clansman I understand.

Cheers Jim.

"bit of rain perhaps .....we do get that on occasions over here" LOL! You could say that ;-)

I see you are not too far from me, I used to live down by the pond when it was there; I used to swim in baths when I was a kid, are they still there? Take your kit there and see if it's true :-) LOL!

I'll see what else I can find out about the moisture resistance of these radios.

Jim, Stuart

I suspect they lasted at least a decade longer in service than the designers expected.

The 320 has a specific issue with 125v rated tantalum bead capacitors which hadn't been around for 30 years when the set was designed - That they were used in a 110v varicap supply was perhaps unwise anyway as well. With the benefit of 10 years hindsight by the time I started work as an electronic designer in 1987 my elders and betters knew enough to warn me off ever specifying tantalum capacitors for anything!

As far as I know (and it has deterred me from opening one thus far) the comparable issue with the 351 is the flex-rigid PCB which is reputed to become brittle with age.

Cliff,
The yobbos put paid to the nice pond years ago.....the council put in two strange looking fountains a few years ago ...looked really awful and stopped working after only 2 weeks never to resume again.....
They rebuilt the surrounding small wall around the so called pond this fell apart in different places, i went and had a closer look as to why and all the mortar was sand it appeared there was very little if any cement added..no wonder it was all falling apart. Told this to the Croydon council...not interested at all.....really good at throwing our money away.
The baths are still there, a bit more modern now and expensive.

"bit of rain perhaps .....we do get that on occasions over here" LOL! You could say that ;-)

I see you are not too far from me, I used to live down by the pond when it was there; I used to swim in baths when I was a kid, are they still there? Take your kit there and see if it's true :-) LOL!

I'll see what else I can find out about the moisture resistance of these radios.

Ian
I worked for Clarke and Smiths (talking books for the blind) and they also would not let us use tantulum caps
for a long time on their products.
I have a 320 set without any problems so far, i switch it on every now and again to make sure its okay
perhaps the caps benifit from this i do not really know.....the ones that fail is it because of leakage???

AND, RACAL wanted just over £1,000, the price they were then charging
the Army, for new ones!
That must have been around 15/20 years ago
I have a number of brand new helicopter versions that I wanted to convert!

Hi Jim,

That's Croydon Council for you..... Merton aren't all that either :-)

Still researching the waterproof claims of the Clansman but finding very little..... I suppose that the claim is "in theory" rather than practice I suspect. I yet to take my 352 apart and have been dissuaded by the same issue a Iain, the flex-rigid PCB degrading over time; I may a non-functioning unit and have a tinker and see it I can work it out that, at least if the flex-rigid PCB is OK in that one I'll have a spare.

Hi Cliff,
Yes cannot see how they could possibly stop ingress of water getting into control spindles even a tight fitting gland after a while would fail through wear.....Have taken my 353 apart to have a nose and also 349, not ventured into the 351 yet .....had a few nice contacts on my 321 set which i added LSB to.....

I guess what we need is a definitive answer from a REME engineer which I surprised we don't seem to have in our membership.....

Either way I don't think I'll dunking my kit under water, I'll stick to "showerproof" ;-) LOL!

Hi group

You do have an ex REME tech in your midst... Voila!

I must say that dunking the radios in 2m of water wasn't in the specification testing, but drying and sealing was.. After putting the radio back together you "should" dry out the insides via that little lug with two holes on and suck all the air out to create a vaccuum.

On some sets when you open them you can still hear a little gush of air as the vacuum is still intact!

I'm not entirely convinced this procedure was carried out by many workshops though - there is rarely time to spend doing it when you've got a shelf full of broken kit in the field that you need to fix ASAP...

So by virtue of the fact that the kit can hold a vaccuum for many years, I'm sure it could in theory withold some water for a couple of hours if all the seals were in place. To be honest, I dont think the rubber on the seals is that bad over time, I havent seen many rotted ones lately, just damaged ones through misuse.. having said that, its quite possible that repair personell may not have replaced all the seals when they put the kit back together, again, this is the kind of thing that could be missed or neglected if you are under pressure to get the kit out of the door

As for the bathtub failure of Clansman towards the end, my view is that could be caused by lethargy of the repair resource rather than sudden failure of the kit.. All the new techs were being trained up on Bowman so the experience of looking after Clansman dwindled, so the number of BLR (Beyond Local Repair) radios must have risen sharply as there was no-one left to fix them!

Steve! We are not worthy ;-) (tug forelock).

That explains the little plug! I was wondering what that was about and would have eventually asked.....

Mind you, a vacuum to keep water out seems a little novel and counter-intuitive..... but thank you for "both" answers ;-)

I can understand the seals being in good repair if not damaged because in the absence of air inside the radio the rubber seals wouldn't rot as quickly as they would in air.

Hello all,
I just had one recently fail in another radio and it was nasty. I was told that they fail because they do not like moisture and if they get a crack on other dammage that will allow moisture in which causes them to fail. I would think that running them near max voltage isn't good either.
As for waterproof, I thought that the majority of military manpacks had to be waterproof to a point as it is just part of combat.

Herb,

Hence the desiccant packs that are supposed to be in the kit and rarely found.....

Is that right Steve?

I think the vacuum was to remove moisture rather than waterproof it. The 319 is specified to be waterproof and has seals around everything inc. the rotary switches so in theory should be ok - no way am I testing mine through!

I've had a couple of 351s in pieces and refurb'd a couple as well and in general they seem to be standing up to their twilight years well.

320's are not so good but the 320 group seems to be developing a good replacement for the PSU which is the main weak points the 320 set.

"I've had a couple of 351s in pieces and refurb'd a couple as well and in general they seem to be standing up to their twilight years well."

Have you come across any dodgy flex-rigid PCB's in you refurb's? reading this has deterred me from delving inside mine.....

Hi Troops,

sorry to put a damper on you ideas,but the answer is really rather basic.There are two 'O' rings of the shaft which goes through the front panel and mates with the switch inside.

Hi Troops,

the internal problems with the PRC351 aren't so much with the flexi-print but with the Kapton (brown) layer which protects the flexi-print.With time this becomes very brittle and will then just shear for no obvious reason.This stuff is also a serious fire hazard if it is raised to ignition temparature it doesn't burn it goes off like a string of fire-crackers.I saw a demonstration of this on the telly when they were investigating a series of fires involving RAF fast fighter jets.

On the subject ofm Tantalum capacitor there are 3 basic types (I'm ignoring the Castanet types for the moment) We have the dipped types ghastly things the failure mode is moisture getting to the pellet by capillary action causing them to go short this being the most common failure mechanism of the capacitors when I was serving in West Africa.There is the type used in the Clansman sets,these were glass to metal seal on one end and resin encapsulation on the other.These fail by one of two reasons (1) capillary wicking as in the resin dipped type.(2)This one is a little more complicated,they are rated at 125v a little close for my liking.The working voltage DROPS as the working temperature rises I forget by how much but it is significant.The thiird type is the hermetically sealed type,the only failures among these I ever encountered were due to over-voltage or reverse polarity.when in both cases went off like a bullet

These notes were based on failure analysis during employment in defence electronics ad the Army

Thanks for note on Tantalum capacitor failures. This was very useful.
Makes me think I should my 320's and 351's in a bag of desiccant and keep them in the fridge :-)
On second thoughts, I will just more and keep for spares.....
Cheers

Not yet, I've pulled a couple apart and they seem to be ok, but those were the M version so they may be newer stock.

Just go carefully I guess and look 4-5 times before doing anything

Hi Cliff,
True. I found two in one of my 351s. I did find that the removable slug on the resistor end of the inverted V antenna had the desiccant cylinder attached to it and the 351 had two packs laying inside.

440. Noisy Receive

Yahoo group: Clansman351
Date: 2012-11-21 19:33:53 UTC
From: g
Topic: 440 Message: 440

And possible transmit as well, I haven't checked yet. The audio is noisy, sort of scratchy, when fed from a signal generator at a reasonable level with a 1 KHz audio tone. This noise can be seen with a scope on the signal going into the rear panel circuit board so it isn't being generated there, or in the headset. It is only present from around 60 MHz upwards and gets worse the higher in frequency you go. Any suggestions as to where to start looking? It is not apparent when there is no signal.

Your welcome. Of course you can use Bell wire, Cat 5 or anything else you like but half a Km of D10 is quite cheap and has some excellent characteristics for both antenna and telephone work - and it looks authentic.

I think the secret will be in the antenna. A net of 351's I recall required some planning due to limited range, provided you could get some height and elevate the antenna you'd be OK up to thirty miles or so - after that you'd use a rebro or some special antenna like the inverted vee. That's in a military setting where you'd could plan and be garanteed a number of stations to work. Compare and contrast the apparently shrinking amateur community. Maybe the way to do it would be to set up a community project and give your local friends a set and a Slim Jim. I have a good QTH and I can hear stations for about twenty miles on the EVHF Low down. Whats yours like?

Regards,

Stu

Not sure where you live but ham licenses are at a all time high in the US.
6 meters where I live is certainly less active. Although the people in 6m
tend to be more technical and have interesting conversations.

Not your typical 2 meter repeater CB talk about your over and over health
aliments and weather forecast, fine business hi-hi....

Holy smokes does that get old!

Oh me and my mouth;-)

I was facetiously referring to Jim's plight in finding local qso partners on the under utilised 4 and 6m bands ;-) although I have to agree the quality of QSO does tend to be higher when people are experimenting and not rag chewing;-).

Not sure where we are actually in UK with licences but I went to a hamfest last week which I perceived to be a bit less crowded than previous years. On the plus side a lot of youngsters are on the air in the hobby here which bodes very well for the future.

73 de Stu ;-)

Curious, Stu

How do your youngsters get involved - Male or female?

Stu

Still on S20? (1615) .

Can you give me the link to the MUF chart again please?

I wrote a battery thing on Forum, but the photo i attached turned out huge.....!

I've noticed a new crowd at the hamfest. That I haven't seen in the past. The preppers, and people concerned about emergency planning.

I suspect this has some to do with popular culture, legitimate beliefs, and some religious faiths have directed their flocks to get their ham licenses.

I think its good for the hobby, people are also more interested in tube gear and green gear because of EMP. Weather you believe in it or not the new faces help our hobby and maybe some of these people with have a life long pass-times.

I've even noticed even on HF some bands here in the states can get pretty crowded.

It's not all crickets out there.

Aha! Now I know why i have Clansman radio gear, a pile of charged
batteries on hand, hand generators and a Honda 3Kw generator to hand.
I am a closet Doomsday prepper.. .....

LOL ! The bunkers would all be filled with water.
320's and 351's fine for this environment if the seals are still intact. With seawater just give them a gentle hose down to stop the battery connections corroding on the battery and radio.

Cheers
Stewart G8YQN

None of these
I have played with Green radios since the age of 14 and that was back in
the early Triassic period.
Started with 19 sets T1154 and R1155 and its been the same story ever since
Gee I wish I had kept those sets and had not sold them for an electric
guitar and amp.
At least I kept the amp and recently restored it (valve of course) and
its worth a load of money...
Cheers
Stewart

Hi Stewart,

It was a rhetorical question really but at least I know where to come if I want a good old valve amp ;-)

Aha! Now I know why i have Clansman radio gear, a pile of charged batteries on hand, hand generators and a Honda 3Kw generator to hand.
I am a closet Doomsday prepper.. .....

On 27/11/2012 16:37, Robert Newberry wrote:

I've noticed a new crowd at the hamfest. That I haven't seen in the past. The preppers, and people concerned about emergency planning.

I suspect this has some to do with popular culture, legitimate beliefs, and some religious faiths have directed their flocks to get their ham licenses.

I think its good for the hobby, people are also more interested in tube gear and green gear because of EMP. Weather you believe in it or not the new faces help our hobby and maybe some of these people with have a life long pass-times.

I've even noticed even on HF some bands here in the states can get pretty crowded.

It's not all crickets out there.

On Nov 26, 2012 4:13 PM, "Stuart Dixon" <dixx@reasignals.net> wrote:

Oh me and my mouth;-)

I was facetiously referring to Jim's plight in finding local qso
partners on the under utilised 4 and 6m bands ;-) although I have to
agree the quality of QSO does tend to be higher when people are
experimenting and not rag chewing;-).

Not sure where we are actually in UK with licences but I went to a
hamfest last week which I perceived to be a bit less crowded than
previous years. On the plus side a lot of youngsters are on the air in
the hobby here which bodes very well for the future.

Sorry - missed you Thats cool, will look in on that - you can set the resolution of most pix by saving them in an appropriate type and size - even the free windows software can do that, its worth experimenting to see what results you get...

Best of luck on getting anyone on 51.00 FM. I've tried with my PRC-351 and had no luck. Sometimes just static. Maybe someone can film a contact and post it on Youtube using a PRC351.

I have had better luck at 70.450 F.M. I have managed a few QSOs using a GSA with its accompanying EKGSA mounted on the 5.4 m mast. From North Walsham Area in North Norfolk to North Norwich & another station could just about hear me at Brundall.

I know what you mean though. I regularly call CQ just using the GSA in the lawn & so far not a sausage! I haven't had any luck getting a contact recently with a newly acquired Pineapple mounted on a Plessey 12m push-up mast. I need to keep a constant watch on the RT351 if one of our dogs is let out, as I discovered that my RT320 is waterproof as he scent marked it when my back was turned. This was shortly followed by said dog being chased back up the garden by me with murder in my heart. The wife saved the dog. It turns out that the RT320 still has its waterproof feature. I don't want the RT351 to be similarly tested.

How about I take the Landy up to Hindhead (960Ft ASL)at 1600 TODAY 28th Nov. And give a blast on 51.500?

Robin GØGNE

Subject: Re: [Clansman351] Re: Monitor 51.500 FM

I have had better luck at 70.450 F.M. I have managed a few QSOs using a GSA with its accompanying EKGSA mounted on the 5.4 m mast. From North Walsham Area in North Norfolk to North Norwich & another station could just about hear me at Brundall.

I know what you mean though. I regularly call CQ just using the GSA in the lawn & so far not a sausage! I haven't had any luck getting a contact recently with a newly acquired Pineapple mounted on a Plessey 12m push-up mast. I need to keep a constant watch on the RT351 if one of our dogs is let out, as I discovered that my RT320 is waterproof as he scent marked it when my back was turned. This was shortly followed by said dog being chased back up the garden by me with murder in my heart. The wife saved the dog. It turns out that the RT320 still has its waterproof feature. I don't want the RT351 to be similarly tested.

Best of luck on getting anyone on 51.00 FM. I've tried with my PRC-351 and had no luck. Sometimes just static. Maybe someone can film a contact and post it on Youtube using a PRC351.

Now lets see, Croydon to Gravesend 20.8 Miles.

Rebroadcast your net Jim?

Good going though, sort of ranges you’d expect.

Regards,

Stu

Hi Troops,

from what I can remember it is a 4CX150 but it isn't in a socket.It is clamped via a BeO black to the chassis and doesn't have a socket the damned thing is spot welded by silver tape to the board connections and it is a pig to get out..The valve seems flat - out it comes in goes a new one no better old valve back in result a radio that still doesn't work properly and nearly 2hrs wasted.I hate the things !!

33. (Google Earth)

Now lets see, Croydon to Gravesend 20.8 Miles.

Rebroadcast your net Jim?

Good going though, sort of ranges you'd expect.

Regards,

Stu

Subject: Re: [Clansman351] Re: Monitor 51.500 FM

I have had better luck at 70.450 F.M. I have managed a few QSOs using a GSA with its accompanying EKGSA mounted on the 5.4 m mast. From North Walsham Area in North Norfolk to North Norwich & another station could just about hear me at Brundall.
I know what you mean though. I regularly call CQ just using the GSA in the lawn & so far not a sausage! I haven't had any luck getting a contact recently with a newly acquired Pineapple mounted on a Plessey 12m push-up mast. I need to keep a constant watch on the RT351 if one of our dogs is let out, as I discovered that my RT320 is waterproof as he scent marked it when my back was turned. This was shortly followed by said dog being chased back up the garden by me with murder in my heart. The wife saved the dog. It turns out that the RT320 still has its waterproof feature. I don't want the RT351 to be similarly tested.

Best of luck on getting anyone on 51.00 FM. I've tried with my PRC-351 and had no luck. Sometimes just static. Maybe someone can film a contact and post it on Youtube using a PRC351.

Jim

Normally narrow for working anything else Clansman or Amateur or ex-PMR.

Wide Tone was for compatibility with Larkspur and American pre-1960s sets that used 50 or 100KHz channels with high deviation and 150Hz CTCSS. Wide is minus the 150Hz tone but still high deviation. If you need wide to be heard it's likely the transducer in your handset or headset is sub standard.

Hope This Helps

Now you mention it, Robin, we did have trouble tuning A41's to the PRC351 frequencies.

We did it by old fashioned methods, but it was never intended to be a requirement

Hi Robin
The 351 specification states F3 modulation and +/- 5Khz deviation so it
is a typical setting for 25Khx channel spacing.
Cheers

Robin,

Sorry I had the aerial switch set to dummy load ...thought the SWR was looking very good...only discovered that this morning.....that mistake rhymes with Clucking Bell .....if you can bear it perhaps we can have a go later tonight??

regards jim g4rek....

511. New Clansman Forum

Yahoo group: Clansman351
Date: 2012-12-07 16:04:40 UTC
From: Stewart Gebbie
Topic: 511 Message: 511

Hi All
I hope this finds you all well. There is a new forum now available for Clansman Radios and this forum does everything that this group does.
It has a special section for 351/352/353 users.
You can find it on http://5820-99-114.com/BB/index.php
(you might need to cut and paste this address.)
I am one of the moderators of this new forum and the intention is to have aUK based forum that is not depending on Yahoo and any changes they make and it is for everything Clansman under one roof. Yahoo does tend to put piles of ads around this site hat are irrelevant.
Now the forum site is new and getting off the ground.
Therefore I am asking everyone to sign up to the new group.
The intention is that with the transition of memebers from this group then this group will be de-activated . Of course everyone will get advanced warning.
The plan is that this group will be shut down sometime after the end of January.
Cheers
Stewart G8YQN

So put the announcement out on the move.
Are you putting an announcemt on the skeds site ?
I can do it but won't put anything about closing it down or else I will get more abuse ...just me know.
Cheers
Stewart

You simple WONT GIVE UP, will you Stewart?
(so who is banned from what - I cannot quite work it out?)

Lets TRY and live in harmony, rather than eating out each others eye's.

I have written to you privately and asked you and you continue to insist
on destroying the existing groups and starting another and different one.

Personally I find separate groups much easier and better to manage than
a single one where one has to search and find what one wants.
So far I don't recall having seen any posting to this new group, which I
did join, despite what I have said above.

Just leave things alone, enjoy what you like, delete what you don't.

Cheers

Mike

518. Some background on the new group

Yahoo group: Clansman351
Date: 2012-12-08 10:01:36 UTC
From: Stewart Gebbie
Topic: 518 Message: 518

Hi all
I have cut and paste the message below from Stu which was posted on the 321 group.
Yahoo is now flashing ads up on the screen when you click to read a message and you have to click through to get tot the posts. Not all of you will have experienced this as yet.
Intrusive advertising is only going to get worse on these Yahoo groups butntonbe fair to Yahoo they do need to increase their advertising revenue.

Message follows :

Dear All,
May I draw your attention to the message on the home page about this group transferring to clansmanradiouser.org <http://www.clansmanradiouser.org> ? You will find a link to the new forums half way down The Clansman Radio User Blog home page - on the right.

At some point this yahoo group (321) will go read only and any new joiners will be directed there. Of course as members of this group you will instantly be welcome to register, as many have already.

Having run the new forum for about three weeks now I can honestly say it is much nicer to administer and I hope new users who have tested it will agree, the more graphical look and feel is easier on the eye and the layout is much easier to follow. The aim is to save hopping form forum to forum and provide a level of consistency for users of the Clansman Radio System.
I am looking forward to developing the new site further in the coming months, especially the advertising sections.
73 de Stu, G4IYK
HTTP://www.clansmanradiouser.org

Hi Troops,
from what I can remember it is a 4CX150 but it isn't in a socket.It is clamped via a BeO black to the chassis and doesn't have a socket the damned thing is spot welded by silver tape to the board connections and it is a pig to get out..The valve seems flat - out it comes in goes a new one no better old valve back in result a radio that still doesn't work properly and nearly 2hrs wasted.I hate the things
!!

It appears the designation 150 relates to output power ie 150 watts, so it seems they are loafing along at 50 watts in the 353 set.....i guess they are welded in for shock reasons..with a socket i suppose it could fall out ?

521. Some messages being wrongly idenfied as spam

Yahoo group: Clansman351
Date: 2012-12-08 10:06:38 UTC
From: Stewart Gebbie
Topic: 521 Message: 521

Hi all
For some reason Yahoo has started idenfiying some users as Spam. I don't know why.
I have to manually approve the posts and I am doing this as fast as I can.
So do not worry if your post has not appeared. It probably means it has gone into the spam box and I of course approve your posts while we figure out how to fix it.
Cheers

Well that will be interesting as I havent had any such experience so far.

No posting at all for the new Clansman Group so far, and of course, dont forget there is yet a further yahoo group already in existence known as the Clansman Larkspur group.

Its going to get more and more fragmented in my view.

Yes, I also have this problem, but usually for my own mails, only!!

Now work that one out - and it refuses to accept me as my own moderator!

Hi Mike
Thanks for pointing out the Clansman Larkspur group as I did not know about that one !
I might be wrong but this new method of advertising forcing you to click through ads to read a post when you have clicked to open a post may be targeting moderators for now. I hope it does not become the norm or it will be extremely annoying and time wasting.
Their is no intention to close down this group as long there are users .
Cheers
Stewart

Jim

I need to check a data book but I would have been more inclined to suspect that the valve rating would be anode dissipation. Having said that a class C FM power output stage should be at least 50% efficient so should have not more than 50W anode dissipation. I expect that it is de-rated for conduction cooling however.

Hi Troops,

the valve used is well underrated true,but we sometimes forget that the input device on rx was also a valve.This was done to make the whole radio a little bit more resistant to E.M.P.The most bizarre thing about the VRC353 was the way in which the initial field tests were carried out

Dear Adam

I know exactly where your coming from here, and you are quite correct. I worked for HRH in the eighties on 'home defence' with L700 and Plessey 450 (RN1, RN2 & RN4) stuff and leaned a lot about EMP and hardening. I believe front line wartime machinery, both ground based and airborne still utilise valve equipment as well as carry state of the art comms equipment for the reason you mentioned. I do think however, you may have opened a hornets nest in terms of people asking questions you don't want to answer.

Hi troops,

firstly my apologies.I did reply with the answer but in error sent it to Mike Buckley as a PM.When the "try-to- break it/environmental chamber stuff" was all over the next phase was the "lets test it mobile etc".This was done by radio amateurs who worked for the company on the bands permitted at the time,they may also have used g9 callsigns.I don't know the callsigns of those involved and would not identify them if they were known because they may still be active.

The West initially laughed at the electronics in the Russian MIG fighters as they were all built with pretty glowing glass bottles rather than the fancy new semiconductors that was now in the US equipment.
The laugh was more muted when they realised the valves were there for the very good reason of being highly immune to EMP (Electro-Magnetic Pulse) damage from a nuclear explosion. In those days silicon based front ends in transceivers were destroyed by EMP.

The nearest effect that simulates this, is seen when your Chinese digital TV settop box falls over following a summer thunder storm or when the storm never happens but the clouds have a high static charge. THE CMOS solid state tuner in the front end is blown out :-(
So you need to go buy another box for £10 to see you through the next 15 months...
Cheers

Hi Troops,
the concept of a mini-nuke being set off in Ilford makes me smile,why poor old Ilford ?.Why not Oban or best of all Westminster ?.I'm sorry to let you down but there companies who specialise in test rigs to simulate E.M.P most are Swiss (why them I wonder ?) or American with a few Germans :-p

Hi there
As a Scotsman I have to object to the Oban suggestion. (why ruin a good whisky?)
But on three principle of being equitable I like the Westminster suggestion but will also add Holyrood in Edinburgh as a good alternative.
Everybody ready to go in AM on 5 MHz with their 320 on 1 Jan ?
Cheers

539. Happy Christmas

Yahoo group: Clansman351
Date: 2012-12-24 10:16:24 UTC
From: Stewart Gebbie
Topic: 539 Message: 539

This my second attempt as I posted a similar message on the Clansman Skrds group thinking it was this group. Honest, I am actually sober.Maybe that is the root of the problem.... So here goes again..
I wish everyone a nice holiday and the best of health, good fortune, and superb fun on their Clansman radios in 2013.
Cheers

546. user handbook for vhf antennae for clansman

Yahoo group: Clansman351
Date: 2012-12-27 14:31:01 UTC
From: G0JKZ
Topic: 546 Message: 546

I'm looking for the 'user handbook for vhf antennae for clansman' manual. I'm wondering if anyone has a link to an online resource or if they have a scanned copy I may have.

Trying to find info primarily on the VHF Inverted V antenna but the other vhf antenna info would be useful too.

The army code number is 61388 and there are also the emers l210 -l219 that have some info in that would probably cover what I was after.

George

Thanks to all those that replied to my request. It has been most helpful.

On looking closely into the inverted V antenna it actually isn't a V at all except in shape but a half rhombic from all the antenna info I have. Once this holiday season it done and i get some time together I will take my 12m mast out and the v and see how well a 351 on a v works. I would probably use the old bbc Daventry site at borough hill.

I'll let the list know when exactly and probably have a couple of others there running my 320 as well, make a day of it. It would be nice to have a map compiled with rough locations so as to know the best orientation for antennas. I might splash out and get a 20w amp too. make it a 352.

All the best

George

If you have the same inverted V that I have, it is sized for a 10M mast

Have you the instruction leaflet?

The instructions say that it is set up on a 12m mast set at 9m by not extending the top and bottom sections.

Which instruction leaflet are you referring to, the mast or the antenna?

Antenna leaflet, the mast could in real time be anything of the appropriate height.

Oh, 9m, well that is a change for me, can you scan the leaflet, please?

Tks

Mike

Thinking aloud, and further

It cannot be Clansman orientated, not that anybody said it was, as the
br army only has 8M and 12M telescopic masts. (that I know of)

The instruction card in the "inverted V" bag just says "mast erected to 9m" - I should scan it for my web site and post the link here. I guess any mast in excess of 9m including the Racal 12M, Clark PU or SCAM would do on that basis although the mast top insulator was designed for a 25mm socket.

I suspect the reason for a 9m or 10m centre will be to maximise low angle radiation and therefore effective range.

There is one 9m mast btw - the Racal MA675 used with NCRS for the monitor antenna is a sectional fibreglass 9m mast like a giant version of the Clansman 5.4m one

Ian,

Do you refer to a green encapsulated card thing?

Odd that as everybody had/has 8M masts. 12M were R Sigs issue

Yes - although the one I had was faded nearer to Yellow than Green! I guess the original intent of the inverted V was rear links of 50-100km above company or Battalion so within R. Sigs remit ?

From: G0JKZ
Topic: 546 Message: 560

Well, the instructions say using 12m mast extended to 9m (top and bottom sections not extended).. so I assume my standard 12m racal is a standard mast and yes, if i leave the two sections mentioned not expanded it is 9m long. The antenna is listed in the Br army manual, it is made by Racal afaik.

I have been doing some research and although the antenna is listed as a vhf antenna, in theory it should work fine all the way down to 7mhz with a reduction in directivity. The transformer unit is simply a 9:1 balun and the resistive unit is a 330ohm resistor in a box. I'm looking at modelling it in eznec to see what the theoretical patterns are but a few online searches show it to be more omnidirectional as the frequency decreases and the wavelength gets closer to 1L.

Robin

As I recall an inverted V for a 9M mast

The angles will not be quite correct on an 8M mast + your bumperette!

They are directional of course, so your pineapple is probably better or
use a washing line one.

From: G0JKZ
Topic: 546 Message: 564

The research I have been doing seems to suggest that it will work over a much wider range of frequencies and the angles are designed for a low take-off. If you change the angles it will still work but not at the same angles so you may find that the range increases if you mount it at a fully extended 12m.

Robin

As I recall an inverted V for a 9M mast

The angles will not be quite correct on an 8M mast + your bumperette!

They are directional of course, so your pineapple is probably better or use a washing line one.

Well, the instructions say using 12m mast extended to 9m (top and bottom sections not extended) . so I assume my standard 12m racal is a standard mast and yes, if i leave the two sections mentioned not expanded it is 9m long. The antenna is listed in the Br army manual, it is made by Racal afaik

I have been doing some research and although the antenna is listed as a vhf antenna, in theory it should work fine all the way down to 7mhz with a reduction in directivity. The transformer unit is simply a 9:1 balun and the resistive unit is a 330ohm resistor in a box. I□m looking at modelling it in ezn ec to see what the theoretical patterns are but a few online searches show it to be more omnidirectional as the frequency decreases and the wavelength gets closer to 1L.

Thinking aloud, and further

It cannot be Clansman orientated, not that anybody said it was, as the br army only has 8M and 12M telescopic masts. (that I know of)

Mike

From: Stuart Dixon
Topic: 546 Message: 565

Hi all,

From Memory The standard mast for this kit is the M12M – one would equally as well fit the bumperette but I do believe a special adapter would be more appropriate. Saw one on the bay not so long ago...might still be there. Otherwise an extension of the homebrew variety might be in order for the M8M. I suggest the radiation pattern may deviate from the desirable if instructions not closely followed.

I suggest modelling a half rhombic to see how it would perform theoretically at various heights and frequencies.

Happy new year everyone, Robin, 5 and 3 to 5 and 8 in QSO with Ian yesterday at about 11:15 on 5.3735C.

Regards,

Stu, G4IYK

Unconfirmed VMARS Member...

Happy new year...

30 to 76 Mhz as advertised? - radiation pattern as for half rhombic. Performance pushed above 100 miles as I recall. Very useful piece.

Hi all,

From Memory The standard mast for this kit is the M12M – one would equally as well fit the bumperette but I do believe a special adapter would be more appropriate. Saw one on the bay not so long ago...might still be there. Otherwise an extension of the homebrew variety might be in order for the M8M. I suggest the radiation pattern may deviate from the desirable if instructions not closely followed.

I suggest modelling a half rhombic to see how it would perform theoretically at various heights and frequencies.

Happy new year everyone, Robin, 5 and 3 to 5 and 8 in QSO with Ian yesterday at about 11:15 on 5.3735C.

Regards,

Stu, G4IYK

Unconfirmed VMARS Member...

Happy new year...

Robin

As I recall an inverted V for a 9M mast

The angles will not be quite correct on an 8M mast + your bumperette!

They are directional of course, so your pineapple is probably better or use a washing line one.

Mike

Subject: RE: [Clansman351] user handbook for vhf antennae for clansman

Well, the instructions say using 12m mast extended to 9m (top and bottom sections not extended)…. so I assume my standard 12m racal is a standard mast and yes, if i leave the two sections mentioned not expanded it is 9m long. The antenna is listed in the Br army manual, it is made by Racal afaik…

I have been doing some research and although the antenna is listed as a vhf antenna, in theory it should work fine all the way down to 7mhz with a reduction in directivity. The transformer unit is simply a 9:1 balun and the resistive unit is a 330ohm resistor in a box. I’m looking at modelling it in ezn ec to see what the theoretical patterns are but a few online searches show it to be more omnidirectional as the frequency decreases and the wavelength gets closer to 1L.

Thinking aloud, and further

It cannot be Clansman orientated, not that anybody said it was, as the br army only has 8M and 12M telescopic masts. (that I know of)

Mike

On 30/12/2012 08:55, Michael Buckley wrote:

Antenna leaflet, the mast could in real time be anything of the appropriate height.

Oh, 9m, well that is a change for me, can you scan the leaflet, please?

Tks

Mike

George

If you have the same inverted V that I have, it is sized for a 10M mast

Have you the instruction leaflet?

Mike

On 30/12/2012 00:46, G0JKZ wrote:

Thanks to all those that replied to my request. It has been most helpful.

On looking closely into the inverted V antenna it actually isn't a V at all except in shape but a half rhombic from all the antenna info I have. Once this holiday season it done and i get some time together I will take my 12m mast out and the v and see how well a 351 on a v works. I would probably use the old bbc Daventry site at borough hill.

I'll let the list know when exactly and probably have a couple of others ther e running my 320 as well, make a day of it. It would be nice to have a map compiled with rough locations so as to know the best orientation for antennas. I might splash out and get a 20w amp too… make it a 352…

All the best

George

Hi,
I wonder if there is a easy way to carry the VRC321 radio about,
My wife and for that matter the girlfriend do struggle to mobilise with just the Bungee ties securing the set on their back.

This would be useful supplemented by a shopping trolley. she would probaby be able to carry the two 12v 75ah batteries and enough ces for a 5 mhz groundstation.

For that matter who carries the batteries. You need another mistress. What about a decent ground plane for the vertical antenna? Yet more " manpower" needed....
I get he wife to carry the 320 in a Bergen on her back, I have to admit I find the headset irksome to wear all the time.....

Cheers

Forget the Clansman and get a WS62 Mule pack. The wife can carry the radio and your rations, and the mistress can carry the batteries, kettle and stove. Don't forget to take both a sun hat and an umbrella.

'Evening Robin

I heard the same rumour. Turns out she's a greengrocers daughter from your neck of the woods (or is it Grantham?). When her dad's not looking, she shops at Sainsburys (allegedly). I think Sainsburys are very good shops - they keep the scum out of Waitrose. They would be even better if they sold ex-mil wireless stuff. No offence intended to any shoppers in any other emporiums (except the ones that bombed our chip shops ;-))

PC playing up so again .....the 353 has a overide switch position but you have to hold it against a strong spring to disable the squelch,,very tiring of course as you would know if you had a 353 set

In that case you have a faulty switch. Noise on is a latching position so doesn’t have to be held on at all.

Sorry George - I thought this thread was related to the 353

In which case I note the absence of any squelch facility controllable by the operator on the 353 (Fully Automatic) see here (http://www.ferret-afv.org/manuals/clansman_vrc353_description.pdf) and the inclusion of a multi purpose override position on the test switch of the 353 which you would not normally use as a squelch control as the fans kick in along with some other features. In effect once you set the mode switch and frequency the need to set and adjust squelch was removed by design I suggest, making the rig as hands free as possible (except for PTT of course).

Hi Stu,
Yes all correct, i was just wondering about the pre set squelch level
as on occasions the meter does move as if there was a signal but very weak not enough to lift it
so hence the question about removing the set squelch level....

Yes, the power switch…

Off – whisper – loud – noise

Noise is squelch over ride.

In that case you have a faulty switch. Noise on is a latching position so doesn't have to be held on at all.

If there isn't a squelch switch then there must be will obviously be a circuit that lifts the squelch so it shouldn't be too hard to add in a switch that sends the correct voltage to the circuit.

Is the circuit diagram available for the 353?

From: dixx
Topic: 609 Message: 611

In my experience we are far too stretched and disorganised to form any kind of net without planning, decent antenners and possibly repeaters.

Reading the manial gives the range of these rigs with various options -

Yorkshire to Croydon via los needs a path profile analysis before locating a rebro or two and/or inverted vee or yagis.

Robin to jim needs some further planning - a 353 on 50w at both ends and a evhf at both ends at 8 or 12m height would get about 50 to 60 miles los

Wot ya got?

Etc

From: jim tylee
Topic: 609 Message: 614

I wonder if perhaps a loud speaker out the top window might be the answer..
 sure i would get a response from the neighbour up the road who always looks by the grimas on his face as though he is sucking a lemon.

Subject: {Disarmed} Re: [Clansman351] Hear Hear

In my experience we are far too stretched and disorganised to form any kind of net without planning, decent antenners and possibly repeaters.

Reading the manial gives the range of these rigs with various options -

Yorkshire to Croydon via los needs a path profile analysis before locating a rebro or two and/or inverted vee or yagis.

Robin to jim needs some further planning - a 353 on 50w at both ends and a evhf at both ends at 8 or 12m height would get about 50 to 60 miles los

Wot ya got?

Etc

Hi Troops,

some mint ones are in collections and a lot more are in re-enactors vehicles or on peoples backs.Other are in use by radio amateurs,I think though that the largest "silent" groups are the Cadet Forces.I've used 352s in the Cairngorms with quite dramatic effect (2 with Ground Spike antenna and the base with Elevated Ground Spike and a 5.4 m mast).This way I get the best of both worlds :-)

What sort of noise was that?

Have you thought of advertising on Clansmanskeds? for a qso parner within 30 miles? Put your mast up with an EVHF on it maybe and then a standard yagi or something? I get hear lots of 4m traffic when I am at home but don't get much chance to qso...

There is life Jim....

No, its usually on the way to work or on the way home. Usually between 5pm and 6pm on the way in and any time between 3am and 5 am on the way home.

If only i could spend time with the mast. waiting to try out the v antenna. I now have the 20w amp on the bottom of my 351 and it works very well indeed according to my power meter and dummy load. Now to just find someone to talk to!

No, its usually on the way to work or on the way home. Usually between 5pm and 6pm on the way in and any time between 3am and 5 am on the way home.

If only i could spend time with the mast waiting to try out the v antenna.
I now have the 20w amp on the bottom of my 351 and it works very well indeed according to my power meter and dummy load. Now to just find someone to talk to!

Hi Troops,
some mint ones are in collections and a lot more are in re-enactors vehicles or on peoples backs.Other are in use by radio amateurs,I think though that the largest "silent" groups are the Cadet Forces.I've used 352s in the Cairngorms with quite dramatic effect (2 with Ground Spike antenna and the base with Elevated Ground Spike and a 5.4 m mast).This way I get the best of both worlds :-)

Probably, i would have to build a mobile antenna for 5mhz though.. And plug it into the 320.

629. problem in a PRC-350

Yahoo group: Clansman351
Date: 2013-02-20 03:12:20 UTC
From: ps7jn_joca@...
Topic: 629 Message: 629

Hi friends,

Today I was test my PRC-350 and it receive fine but not transmit. I open the unit and see a module number 5820-99-626-2671 (in catalog is reference as "transmiter and filter") touch a point near a coil I receive full strengh signal in a receiver but in (supose) output of module none signal.

So, to make unit to be funcional, I need the PRC-350 circuit diagram and some tips as disassembly the module (I suppose it be strongly fixed and inacessice according to Murphy´s law)

73, Joca PS8JN

From: David
Topic: 631 Message: 631

Greeting List Members from NZ

I have 351's and 350's and am looking into re-celling the batteries for them.

Could someone tell me the voltage range accepted by these radios for safe operation please?

I know that:

350 nominal 15V
351 nominal 24V

However I am aware that re-chargeable cells often have a variable voltage and often run at slightly lower volts than alkaline disposables so I am needing to know the acceptable voltage range for these radios in order to work out the rechargeable cell numbers and configuration required...

Many thanks
David

Hi there
A Ni-Cd cell voltage is nominal 1.2 volts charged. The 351 battery has 20 cells making up 24 volts. The batteries can reach 27 volts after just charged. Non rechargeable batteries have a voltage of 1.5 volts. So if you want to keep the nominal voltage of 24 volts, then 16 cells of non re-chargeable batteries should be connected in series for the same 24 volts nominal,
The spec of the the radio that I have just says battery voltage 24 volts nominal.
Cheers
Stewart

Hello from state side

I use 2x4.5ah SLA's to redo my 4ah 320/351 24v boxes it is the most bang for the buck. They just fit in the aluminum ones you might have to beat out the dents on the corners I have had to. You will also have to remove the charging connector. Weights a little more than the Nicads if you are not going PM then it is no a big deal. I use a dry cell holder on the 350 with "C" carbon cells. After working on the contacts for the batteries it works great.

Good luck 73's

Stewart, David

I think the lower limit where the radio has intermittent squelch opening is around 20v for the 351 - the 16AH single use Lithium packs are at least 30v when new at the upper end.

With the 350 C cell pack it may be worth fitting a dummy pair of cells in one tube to reduce the voltage when using dry cells rather than Ni-Cad or NiMH

Regards

Iain

Hi Joca

You can't just pull the module out, you have to remove the motherboard and all the modules from both halves of the casing to get at all the soldered pins and the module cover

The modules are all layered with 2-3 cct boards, so the components are very difficult to get at..

You may be better finding a non working 350 and swapping the module out rather than trying to fix it

Email me and we can have a chat if you like

637. No transmitted audio from 351

Yahoo group: Clansman351
Date: 2013-03-04 13:24:01 UTC
From: growntree1
Topic: 637 Message: 637

Hi,

I have been having problems with a PRC351 where when transmitting on 6m to a fellow ham a few miles away, he receives my signal at 40 over, but with no audio. I have tried a number of headsets with different pressel leads (both in live and non-live switch positions) and a handset. I have tried both audio connectors on the 351 and have tried with both a charged battery and a battery still connected to the charger. I can recieve his audio and when I turn the set on, I can hear through the headsets that it has turned on, although the unsquelched (*) setting sometimes doesn't give the standard FM unsquelched hiss even though I can still hear the difference between turning the set on or off. Is there something I'm missing or is this particular 351 just faulty in some way?

Cheers for any help

Graham

Hi
It looks like it has a fault with no modulation and I assume you have the radio set to" L" on the mode switch. If this is all set then it's fault finding time. If you are lucky It might just be in the audio path so I would open it up and check the audio sockets and trace back to see for broken connections.
Cheers

Hi Steve,

Thanks for replying. I did once. I had actually forgotten about that as I've been messing about with different headsets and pressel leads for a few weeks now ;) The one time sidetone did work, I've been reminded that it did actually transmit audio that one time, but it was particularly quiet at the other end. The time it did work, wasn't the first time I'd tried it, but whatever the circumstances were that made it 'sort of' work, I haven't been able to replicate them.

Cheers
Graham
G7DKY

Hi steve.

So... Many thanks by your help. The disassembly was as you describe in your text. To take out the transmitter module I did need unsold all terminals (hard work if you not have the correct tools) I unscreww the transistor dissipators and I found my suspect: a 2N3553 driver. change by another (yes, I unlead the terminals and pull out by dissipator) and assembly all. torn on and silent! check the fuse was unsoldered. connect it again and the radio now is transmittiong and receive good!

thanks agn, Joca PS8JN

Hi steve,

very nice your explain about disassembly the radio. Soon I back to home I will disassembly it.

I am powering the radio with 14 C-cell cassete using 1,5V cells total 21V but nominal supply is 15V. is possible this voltage damage the TX module of this unit or the radio accept 21V without problem?

643. 351 low output

Yahoo group: Clansman351
Date: 2013-03-12 14:15:27 UTC
From: Robert Newberry
Topic: 643 Message: 643

I have a 351 with a 20 watt amp. I noticed. I was only getting 10 watts into my service monitor. I checked the 351 direct and I was getting 3 watts. I have another 351 that I believe makes 7 watts. I have yet to try my other 351 with the amp....but I suspect the problem is the 351 not driving the amp fully. Anyone got any tips diagnosing low tx output?

I am going to when I get a chance try using my lab power supply and other radio to rule out the amp and battery. Just not home yet to try it.

644. Re: 351 low output

From: slack5874
Topic: 643 Message: 644

Hi Robert

The data sheet quotes power output is anything over 2.5W so your 3W actually looks ok.. 20W amp is anything over 13W, so not far off... Are you on the correct band on the amp? That could cause a dip in power if not.

The 7W looks a bit high, most 351s should be around 4W, as can be seen by the rating of the 4W surf

If you want to try upping the power a bit, try tweaking R6 on module 18 inside the radio (carefully!)

Anyone know if any Clansman gear ends up at Dayton? I'm going to be heading out there this year. Might be a good opportunity to pick some stuff up.

I plan on putting out a few emails to the various list in hopes someone might even have something I'm looking for they can bring out.

Well I know ebay as the usual source problem is will they ship to the US?

I'm looking for:

Carry straps prc-350
Remote handset
Hand crank generator
Rocket pouches (good condition)
Haversack (good condition)
Vhf ground spike antenna
Chargers

I am interested and will consider just about anything Prc-320, 350, 351, am-352 parts monsters.

I'm looking to be well "kitted" out in Clansman.

I plan on putting a list of items to various groups soon for Dayton in hopes it will show up.

I'm hoping maybe if any of our friends from "across the pond " fly over maybe they'll be will to pack a small item for me...

Thanks for the info. I checked and ya one of my 351s puts out 6 watts the other puts out 3.6 watts. I have only tried that amp with the 3 watt radio. I want to try it with the 6 watt radio see see what kind of power the amp makes.

So your telling me anything over 2.5 watts on the 351 is AOK? And anything over 13 watts on the amp is OK?

The only thing that concerns me the amp was making a little over 10 watts.

From: g7psz
Topic: 657 Message: 657

Dear all,

Sorry if this has already been discussed, but I have been searching on the web for some time.

Does anyone know where G0TJH's mod for extending use down to the top of 10m has been published? The 353 mod is freely available but I seem to be unsuccessful finding the version for the 351.

Also, I presume the maintenance manuals are still classified and only available through VMARS. They seem to be a difficult mob to join -three attempts have been unsuccessful so far.....

Hi there
My experience is that I have had really good service from the archive system of VMARs. I searched the Vmars manuals site and sent the reference info requeste to the archivist email address and got a reply within a day . Sometimes hours.
There is a mod for the VRC353 which is documented at
http://www.clansman-radio.co.uk/353-10m-mod.pdf
This will give you some idea of the work. The 351 mod which at the time of writing I cannot locate does require if my memory serves me correctly, require some alignment of the radio. The 351 is not an easy radio to work on! It opens like a book and the flexible circuits are now getting brittle with age so there is the risk of causing I intended faults while doing any mod.
Cheers

Steve

When I do my next 351 mod I'll take some photos and do a write up

I'll stick a copy on here when I'm done

Steve

The 349 mod would be a much more interesting prospect - to any ham band - the 351 already covers 2 bands - but hundreds of 349's are useless unless you pirate a channel.

Be interested to locate the 351 10m mod all the same.

Hello
I have just got hold of a clansman hand generator it looks to be in very good condition I have measured the voltage which is normal only thing is the does not work even when turning at different speeds I have cleaned the area where bulb is for dust / dirt etc I know it still works but I like things in full working order
any ideas
andrew

Be interesting to test it under load - the manuals might have some clues as to what the output should be and the charge rate available. To be honest Ihave never used one, but the way it sits between the battery and set suggets it was designed to "float" charge the 1Ah battery. Suggesta lot of puff is required to keep one of these going ;-) so a motorised test rig might be more applicable. I'm sure the contributors on this group will come up with some info. I always buy at least two of everything clansman for spares purposes.
 They look easy enough to service though.

From: Robert Newberry
Topic: 665 Message: 665

I rebuilt a nicad battery pack for my prc-349. I replaced them with 10 aa nicads rated at 1000 ma apiece.

I checked voltages and everything looked good.

Against my better judgement I brought the pack to work to charge it on a variable power supply. I hit the road to go on a service call. I realized that I left the pack charging after I was in the road. I figured I would wait until lunch and call in to have a tech in the next office over shut it off.

Well I put the pack in at 8AM and set it to 15 volts, current was at .5 amps. Well I got a phone call at 11AM. That the battery pack went pop, smoked, and was super hot. The tech thru it outside. I haven't surveyed the damage, but sounds like I'm going to need a new pack and batteries.

What did I do wrong?

Any number of things amongst consult an expert, (google or wikipedia), research the correct method of charging, Calculate the actual charge rate, Set a timer, and or Monitor the voltage change. All recomended on various websites. I was wondering why off the shelf battery chargers charge these cells in parallel and whether charging them in series was a problem. Can't see it.

Anyone?

Well I think I know what happened, I thought the current was limited at .5 amps (I really should of limited it at .25 amps) My power supply was set to a higher range, thus I should of been reading a different scale. I really was hitting it with 1 amp which at three hours was much too much for that battery pack.

Hi Robert,

I'm afraid you fell foul of simple mathematics.

1000mAh (or 1Ah) batteries, in an ideal world can supply 1amp for an hour, half an amp for two hours, a third if an amp for three hours and so on and so forth. A you said you charged them for three hours at half an amp, that would equate to 1500mAh. Where does that extra 500mAh go? In the case of nicad batteries, heat, then pop.

The official clansman charger (in the case of the 24v batteries at least) relies on two diodes in the battery pack to detect the temperature change and shut off the charge, which while rather basic works...

Intelligent battery chargers of the type used for charging radio control car batteries would work better as they will have been designed to be able to detect when the battery is fully charged and although they cost about £30 in the UK, they'll safe you money from having to replace battery packs and coworkers. ;)

Also, while 15v isn't excessive, 14v would have been a better voltage

How that helps,
Graham

From: Robert Newberry
Topic: 669 Message: 669

I'm looking for some parts for my clansman stuff so I am cross posting to various list. I have over seas sellers and ebay, but I am curious if anyone in the US has any parts to save on shipping, before I check sources that I know have the parts.

Looking for:

PRC-349 - battery cassette, radio holster, bnc adapter

PRC-351 - battery crank, remote handset, rebuild-able battery, ground spike antenna, battery extension cable

PRC-350 - carry harness

Please excuse my phones attempt at autocorrect, and in reply to your latest email, that would be 3000mAh (3 hours x 1 amp) into some 1000mAh batteries... Or possibly 2500mAh as it may have taken the tech half an hour to recover from witnessing a battery pack combust in front of him. ;)

Robert

Probably tried too high a charge current without a cutoff when charging was complete. Purpose built Ni-Cd and Ni-MH battery chargers are constant current sources and either operate at a safe long term charge rate less than 1/10 of the capacity (so a 1000mAH cell should be charged at less than 100mA and will be safe for 10-12 hours) as in the Clansman slow charger plates, or have a cutoff mechanism based on temperature (as in the Clansman ACCU and DCCU) or the rise in cell voltage at the end of charging (as in the Clansman IBMS and most home NiCad chargers).

At 0.5A I would expect maximum 1.5 or 2 hours before overcharging

Regards

Iain

Fortunately 2 of the 3 techs that work here (me being one of them) are volunteer fire fighter/emts. When someone yelled fire everyone stood around in horror watching my battery pack go Chernobyl, he grabbed a fire extinguisher when he realized what was going on, he just shut the supply off and grabbed the test leads connected to the battery and tossed the battery out the garage bay door into the parking lot to let it cool and didn't go near it until things calmed down.

It was my own stupid fault I was in a fog this morning, I've done this a thousand times, with other batteries. For some reason I was reading the wrong scale, and even the scale I thought I was reading was too much current! I had an anal cranal inversion...big time!

673. RE: {Disarmed} Re: [Clansman351] What did I do wrong

Stuart

Charging in parallel allows the fully charged condition to be detected independently for each cell.

Charging in series – as must be done in a pack – results in shorter life because voltage isn't evenly distributed down the chain of cells depending on conditioin, temperature at that location in the pack, etc and some cells will get more abuse than others. Charging fast and in series – as was done for good reasons with military radio batteries – is the worst of all worlds.

Not surprisingly the main problem with Clansman batteries is 1 or 2 cells failing short circuit – this seems particularly likely in seasonal use where a battery is put away charged and then brought out months later and I have killed several NOS boxed batteries in 3 years that way.

Regards

Iain

I'm sure it suitably woke everyone up... ;)

The battery charger I used for the 24v batteries before I got the clansman charger worked rather well. I'll send you details if you like when I get home. It runs of 12 ish volts (car battery, 13.8v psu etc.) and can detect the required voltage for whatever battery pack is connected (28v for the 24v batteries down to whatever 1.2v batteries require) and can be current or time limited and is quite small and portable. It's really designed for charging batteries for radio control cars, so why it can happily supply 28v, I don't know...

Yes please send those charger details. I've decided along with a new 349 battery I'm going to buy a charger you speak of. I've done this power supply method works fine, but when you have a brain fart it gets expensive.

Sure I'll take that pic, I googled it and it says pb battery voltage 20v.
Is this correct? I thought you said you could charge 24v batteries.

Cool,

Thanks Iain (and all) for this informative thread.

Stuart

Charging in parallel allows the fully charged condition to be detected independently for each cell.

Charging in series – as must be done in a pack – results in shorter life because voltage isn’t evenly distributed down the chain of cells depending on conditioin, temperature at that location in the pack, etc and some cells will get more abuse than others. Charging fast and in series – as was done for good reasons with military radio batteries – is the worst of all worlds.

Not surprisingly the main problem with Clansman batteries is 1 or 2 cells failing short circuit – this seems particularly likely in seasonal use where a battery is put away charged and then brought out months later and I have killed several NOS boxed batteries in 3 years that way.

Regards

Iain

Any number of things amongst consult an expert, (google or wikipedia), research the correct method of charging, Calculate the actual charge rate, Set a timer, and or Monitor the voltage change. All recomended on various websites. I was wondering why off the shelf battery chargers charge these cells in parallel and whether charging them in series was a problem. Can't see it.

Anyone?

Subject: [Clansman351] What did I do wrong

I rebuilt a nicad battery pack for my prc-349. I replaced them with 10 aa nicads rated at 1000 ma apiece.

I checked voltages and everything looked good.

Against my better judgement I brought the pack to work to charge it on a variable power supply. I hit the road to go on a service call. I realized that I left the pack charging after I was in the road. I figured I would wait until lunch and call in to have a tech in the next office over shut it off.

Well I put the pack in at 8AM and set it to 15 volts, current was at .5 amps. Well I got a phone call at 11AM. That the battery pack went pop, smoked, and was super hot. The tech thru it outside. I haven't surveyed the damage, but sounds like I'm going to need a new pack and batteries.

What did I do wrong?

Hopefully all that are interested can see the attached picture. If not...at the bottom is a Watson w-25am psu, powering the power-tech c6 which is putting out getting on for 26v into the 4Ah clansman secondary battery behind it. The actual voltage displayed does vary a bit as it displays the battery voltage. I have set the charger to 0.5 amps, which when set, the charger treats as a maximum, so varies between nothing and 0.5 amps throughout the charge cycle. Currently it is showing 26.04v at 16 minutes elapsed time.

A coworker put me on to this charger when I mentioned to him I had a 24v battery to charge and lent me his when I was a bit sceptical about it being able to charge 24v batteries. The original battery, whilst cosmetically very good lasted about 5 minutes on this charger before the charger refused to go any further with it and the official dccu 14 charger just said instant fault with it, so was obviously a duff battery. The battery in the picture looks like it has seen front line action due to how battered it is, but is fine with dccu14 and the c6. Neither battery gets warm when charging. The c6 also doesn't get warm. The dccu14 gets quite hot during use just as a point if interest...maybe it is designed as an additional heater for the gs land rovers...

Thanks - have invested in one as an alternative to dccu and general purpose unit after your write up. Will load up a 349 battery cassette with as many rechargeable AA s as I can muster - All same capacity and see how it gets on. On the topic of power supplies for the 349 one mod of note is to mod a cassette by connecting its terminals to a 12v nominal PSU. Does away with all this battery malarky. ;)

Regards,

Stu

With all these Clansman 349's about be good if there was a transverter to
go to 50 megs
g4rek

Jim

Actually the 349 _ought_ to be convertible to 6 or 10m directly. Most of the radio actually works from 2 to 12 MHz and the top board of the 3 in the synthesiser can contains independent TX and RX crystals and mixers to shift it to "any 10MHz band between 30 and 70MHz" according to the original Racal-BCC marketing (it was a private venture added late to Clansman and more advanced in some ways than 350/351 - I guess the RT350 was originally meant as the squad radio ?) .

I know someone forked out for a pair of xtals to move it up by 5MHz so 45 MHz dial is 50MHz at the antenna, but they were defeated by the sealed PA/RF module - if that can be retuned or replaced a 349 on 6 or 10 metres is quite possible. I would be happy to source SG8002s as xtal substitutes if there is demand, as I did for 320 & 321 LSB. I have some spare 349 synthesiser PCBs if anyone wants one to experiment on - unusually the EMER shows the full schematic for this board as well, which is helpful.

The PA/RF board is less well documented but it is at least a plug in module and the pin out & block diagram are in the EMER. So I think a modern replacement is the way out.

I expect the work required for a 349 is to replace the oscillators or xtals on the top synthesiser board and build a replacement RF/PA can optimised for the chosen amateur band. I think the replacement RF/PA would need to be based on surface mount parts to have much chance of hand assembly while still fitting a recycled original can. On the plus side an output in excess of 250mw should be possible!

One other interesting feature is that the 349 has separate TX and RX band setting xtals so should be able to work through repeaters.

Ian,
Thanks for the information on the 349 set, i have 3 of these radios all working they appear to put out about 250 milliwats give or take a bit..be nice to actually use them
Jim

Ian,

Thanks for the information on the 349 set, i have 3 of these radios all working they appear to put out about 250 milliwats give or take a bit..be nice to actually use them

Jim

Actually the 349 _ought_ to be convertible to 6 or 10m directly. Most of the radio actually works from 2 to 12 MHz and the top board of the 3 in the synthesiser can contains independent TX and RX crystals and mixers to shift it to "any 10MHz band between 30 and 70MHz" according to the original Racal-BCC marketing (it was a private venture added late to Clansman and more advanced in some ways than 350/351 - I guess the RT350 was originally meant as the squad radio ?) .

I know someone forked out for a pair of xtals to move it up by 5MHz so 45 MHz dial is 50MHz at the antenna, but they were defeated by the sealed PA/RF module - if that can be retuned or replaced a 349 on 6 or 10 metres is quite possible. I would be happy to source SG8002s as xtal substitutes if there is demand, as I did for 320 & 321 LSB. I have some spare 349 synthesiser PCBs if anyone wants one to experiment on - unusually the EMER shows the full schematic for this board as well, which is helpful.

The PA/RF board is less well documented but it is at least a plug in module and the pin out & block diagram are in the EMER. So I think a modern replacement is the way out.

I expect the work required for a 349 is to replace the oscillators or xtals on the top synthesiser board and build a replacement RF/PA can optimised for the chosen amateur band. I think the replacement RF/PA would need to be based on surface mount parts to have much chance of hand assembly while still fitting a recycled original can. On the plus side an output in excess of 250mw should be possible!

One other interesting feature is that the 349 has separate TX and RX band setting xtals so should be able to work through repeaters.

I have a 351 also an ac adapter unit that has a switched 14v / 28v output i have seen a cable with a two pin conector at one end and a batery/radio conector at the other(same as battery extension cable) would it be possible to power the radio direct from the mains unit.
thanks
andrew

Andrew,

It would be possible, but it would be better to stick with powering through the battery, as the battery will filter out any voltage or current spikes that may appear from your Mains unit.

Graham makes a good point. This is dependent on the quality of the power supply.
For example, the power supply could overshoot the 28 volts on switch on. A bit like giving the radio a hard kick. I use the extension cable and run my 320's and 351's from batteries and charge the batteries when needed.
Cheers
Stewart

Possibly out of ignorance, I have been running a '352 on a 28 vdc mains power supply for many months with no issues. This PS is an older linear type, not switching type, so, IMHO somewhat more foolproof. Just in case, it is equipped with an over-voltage crowbar.

Perhaps the manual directive to keep a battery in the circuit originated for vehicular use where terrible quality DC would be expected?

I would add the preferred method in my shack is to use the dccu to float charge the battery while it is on the set. The psu can then be used to power some other rig. The widney aish then serves as both a charger and a psu for a 352, 320 and a 321. Which can all be operated simultaneously.

Regards,

Stu

Well, if I understand the post, the first level of the 349 works at hf and is then multiplied to its final frequency. To actually getting a 349 on hf would be nigh on impossible though. And what would you do with an fm set on 2-12mhz?

If not...at the bottom is a Watson w-25am psu, powering the power-tech c6 which is putting out getting on for 26v into the 4Ah clansman secondary battery behind it. The actual voltage displayed does vary a bit as it displays the battery voltage. I have set the charger to 0.5 amps, which when set, the charger treats as a maximum, so varies between nothing and 0.5 amps throughout the charge cycle. Currently it is showing 26.04v at 16 minutes elapsed time.

701. RE: [Clansman351] Re: What did I do wrong

Yahoo group: Clansman351
Date: 2013-06-04 20:25:44 UTC
From: Iain Moffat
Topic: 666 Message: 701
Attachments: 1 described; binary payloads are missing from this source WARC

George, Simon

The up conversion is by mixing with a fixed xtal - from memory it's 2-12MHz mixed with 48MHz xtal gives 48-2 = 46MHz and 48-12 = 36MHz

Just change the xtal (and the receive counterpart which is higher by the IF) to get a different 10MHz block. The xtals and mixers are on the top board in the synthesiser under the large can near the tuning knobs.

The problem is the RF module which contains the t/r switching, PA and receive mixer. This is a pre-tuned and sealed unit and cannot be shifted when the local oscillators are shifted. So someone needs to find a stock that aren't sealed, design a modern replacement, or find a way of opening them without destroying them so they can be retuned !

Regards

Iain

That's exactly how I thought it would be, I just understood the question to mean that the op wanted to use the radio on 2-12mhz.. possible but then it would be unrecognisable by the time you tried to fit hf sized coils and tuned circuits into it.

> >> Thanks - have invested in one as an alternative to dccu and general purpose unit after your write up. Will load up a 349 battery cassette with as many rechargeable AA s as I can muster - All same capacity and see how it gets on. On the topic of power supplies for the 349 one mod of note is to mod a cassette by connecting its terminals to a 12v nominal PSU. Does away with all this battery malarky. ;)

> >>>> A coworker put me on to this charger when I mentioned to him I had a 24v battery to charge and lent me his when I was a bit sceptical about it being able to charge 24v batteries. The original battery, whilst cosmetically very good lasted about 5 minutes on this charger before the charger refused to go any further with it and the official dccu 14 charger just said instant fault with it, so was obviously a duff battery. The battery in the picture looks like it has seen front line action due to how battered it is, but is fine with dccu14 and the c6. Neither battery gets warm when charging. The c6 also doesn't get warm. The dccu14 gets quite hot

during use just as a point if interest...maybe it is designed as an additional heater for the gs land rovers...

If not...at the bottom is a Watson w-25am psu, powering the power-tech c6 which is putting out getting on for 26v into the 4Ah clansman secondary battery behind it. The actual voltage displayed does vary a bit as it displays the battery voltage. I have set the charger to 0.5 amps, which when set, the charger treats as a maximum, so varies between nothing and 0.5 amps throughout the charge cycle. Currently it is showing 26.04v at 16 minutes elapsed time.

It runs of 12 ish volts (car battery, 13.8v psu etc.) and can detect the required voltage for whatever battery pack is connected (28v for the 24v batteries down to whatever 1.2v batteries require) and can be current or time limited and is quite small and portable. It's really designed for charging batteries for radio control cars, so why it can happily supply 28v, I don't know...

704. 349 Battery Cassette - Cheap AA NI MH 2500 mAh

Yahoo group: Clansman351
Date: 2013-06-16 20:10:52 UTC
From: Dixx
Topic: 704 Message: 704

If you are looking to fill a 349 cassette - Lidl are selling 4 NIMH AA for £2.99 - I say again - 4 for £2.99 this week.

Fill a cassette for under £9 as opposed to the Asda equivalent at just under £30.

73 de Stu, G4IYK

PS Powetech C6 - good investment. Thanks to Graham Rowntree for posting the info.

The down side to that, as an idea, is that you don't get full voltage which needs an extra cell.

1.2 as against 1.5 pwer cell.

I have new, unused 12v nicad batteries (made for the job) for sale, if anybody is interested. - has anybody got inside one of these to ascertain if they have an extra cell? They charge from the 6 slow pack.

Attachments: 1 described; binary payloads are missing from this source WARC

As I understood it the set has a 12v nominal rating but the other option is to use Alkaline Cells (1.5v) which I always thought was a bit of a waste of money...very naughty and for what? (or Watt as the case may be). I also think the limiting factor to this idea would be the size of the battery cavity which without adding extra length to the cassette it would be v difficult to insert another cell. Who knows the content of the black magic box?

Dear Mike,

According to this its 10 cells,

http://www.vmarsmanuals.co.uk/newsletter_articles/clansman_test_set.pdf

What is the current rating of the official 349 nicad?

Stu

The official rechargeable ni-cad for the 349 is 6140-99-661-4865
and come off the IBMS at 14v. I cannot tell you any more than that,
presumably the cassette is intended to give 15v+ with new cells, while
if filled with ni-cad cells would give 11.2v
I will wait for a day and see what the 14v drops down to.

Mike

This one was not mentioned in Murray's article

Thanks Mike,

I got the Ahc rating - 0.55 Ampere Hour.

I filled 2 cassettes and have one at 1300 mAh and one at 2500 mAh you have to charge at less than 500 mAh otherwise the fuse will blow but the main problem is finding a cassette in good condition - I have five, one of which looks like a chinese copy and doesn't have any fuse at all. I wonder where that came from? I got two out of the other four working and now need some more fuses and a repair...ho hum, it was the same in service as I recall. Not the best system I have seen.

So it looks as if the lidl option was good value for money as the clansman nicad delivers approx a third of the capacity for about 15 quid.

Regards,

Stu

Lazy maths - apologies its about a fifth....probably the failure rate should also be considered..

Stu

For me I would never charge them as a complete cassette, rather take out
the ni-cads, and charge separately -much safer.

I have new cassettes with fuses of course!
Never been a problem if they are after - leave them with cells inside
and you have problems awaiting!

Muike

I'm experimenting - but can't see the difference between the "official" nicad and a cassette filled with NiMh. I assumed Internally they must be wired the same less the fuse. The C6 charger reccomended in previous threads did a good job in controlled conditions bringing them up to the right current state so far...

Will look for a source of new cassettes...

Thanks for your input - very helpful.

Regards,

Stu

Hi guys, thought I would introduce my self, I've been licenced since 1976, mostly on VHF, since I managed to re-activate my late Father's call GW3FSP I've been far more active on the HF bands with a variety of HF sets, including the Clansman PRC 321 kit I've got hold of.On VHF I generally use my Yeasu sets, FT290,FT480,FT847, UHF FT780 and FT847, along with some 23cm and 13cm ATV kits I've put together, Also bought a 351/2 kit to cover 4m and 6m when I get out portable rather than use the FT847. I also have one of the ex-military VHF aerials > Aerial Yagi No2 which covers the 4m and 6m bands.
I also have the NiCad batteries and a 12v Clansman charger, will be exprimenting on re-furbing a couple of very dead NiCad batteries by replacing the D cells with Double cells I've managed to source which are 4AH, although I understand cells up to 8AH are available. Will be perusing the earlier posts for snippets of information on this kit so bear with me as I will not be posting for a while as I need to collect as much info on this kit as I can first.

Hi Barry, sorry not ringing any bells at all, The only Totterdale I can remember was Alf Totterdale who lived just off the A470 I think in Tongwynlais but that was a long time ago, he used to work for GB Kalee with my old man.

Hello,

I am a new member to this group. I have recently purchased a Clansman 351 radio, so I thought I would join the forum.

There are only a couple of problems that I have. The first is that I don't have a battery charger, so once the batteries are flat, I will not be able to use the radio. It came with a couple of charged batteries, so I am alright until I use them all. I am aware that I need a DCCU, but I am not sure how to power it, as it does not have a standard plug. I was also told by the guy who I bought the radio from that there are DCCU chargers which have a safety in them to stop from overcharging the batteries, where as older ones don't?

The other problem is that one of the battery clips is bent, which makes it difficult to attach the battery. Is there a technique to bending them back into shape without damaging them?

Also, are there any times that the radio users get together to have a chat? I am in Suffolk.

Thanks,

Jack. M0HER.

Hi Jack

Also in Suffolk (just - near the Essex Border about 5 miles South of Ipswich) - happy to try on the 351/2 or with a 353 and elevated VHF antenna if necessary on 4 or 6 metres. There are a couple of other Clansman ops locally - the GB2SAH/GB100RSGB operation at RAF Foxhall Heath on the 26th/27th July will be the next gathering. Which end of the county are you ?

There are 5 charging options:

1) DCCU fed from 12V or 24V vehicle supply. This is a fast charger with thermal cutoff. 2 of the 4 wires in the charge cable connect to the temperature sensors. All DCCUs are supposed to cut off when fully charged - the modifications to later ones were to address various failure and safety issues. Look for a DCCU with a white plastic guard around the 4-pin charge socket and look for charge cables with a tapered strain relief rather than an abrupt transition from wire to plug at each end. The main risk with early ones is that a bad connection to the temperature sensor can result in a boiled battery if it never cuts off the charger. I have some new style leads and you can have one if need be.

2) DCCU with slow charger tray. This 2-battery tray connects to a DCCU with a normal charge lead but has places for two batteries and limits the battery current to a trickle charge rate that is safe to leave for a day or two.

3) Clansman ACCU - this is a 16-output charger based on the same technology as the DCCU. Very heavy and not reliable.

4) Clansman IBMS - this is a modern voltage sensing charger with trays for various combinations of batteries. It is capable of reconditioning mildly unwell batteries and automatically switches to trickle charge when they are as full as is safe.

5) A modern commercial reconditioning charger - people on here have good results with several kinds to be found on e-Bay. I don□t personally use one so cant make a recommendation. These are likely 1/4 the price of an IBMS or ACCU and probably kinder on the ageing batteries than an IBMS.

Having said that the Clansman batteries don□t take kindly to amateur use - usually charge, deep discharge, and store until the next event rather than regular use. Even NOS ones have failed on me in 3 or 4 years. So you may be better getting a couple of defunct batteries and installing small gelled lead acid batteries - I think you will find ones around 2ah 12v of which a pair will be a tight fit, and can then be used with cheap commercial chargers. I can probably donate a dead plastic ni-cad case if you want one.

The DCCU power input lead is Clansman standard - a 2 pin pattern 104 connector. These should be between £5 and £10 on e-Bay e.g. 251293346141 . Does your DCCU have a label saying if it is 28v or 14v ? If the latter it will run off a normal 12v supply although you should operate it at the highest voltage you can - the 14v dccu is not reliable if operated from lower voltages. If it's a 28V type you need a 24V vehicle or a 24V 4A mains PSU.

Mail me off list on g0ozs@... if you want to sort out the missing bits locally. I will be a bit distracted over the next few weeks but should have some time during August

Regards

Iain

I ended up rebuilding my batteries with the same type of batteries Ian mentioned. I already had the multi stage charger for them. The SLA's are cheap and plentiful. The same goes for the chargers.

Thanks for the information. I don't have a DCCU at the moment, but now I know which system to look for. As for my location, I am near Bury St Edmunds.

Do you have any more information on the RAF Foxhall gathering?

Thanks for your help, and everyone else who replied.

Jack.

724. Antenna questions

Yahoo group: Clansman351
Date: 2013-07-31 14:29:18 UTC
From: gw3fsp
Topic: 724 Message: 724

Hi Guys, has anybody got the info on the ground spike antennae and elevated antennae kits, I've got both kits but there's no info with them as to how to put them together.
The ground spike kit has a small lead included with strange looking (bnc type) connectors on it, what's it used for ?.
The elevated antennae kit has several small patch leads and a choke, what are they for ? how do they go together ?
Leighton. GW3FSP.

There should be a plastic laminated card in the kits with the parts list one side and an assembly diagram the other - if you don't have that let me know by direct e-mail and I will send something off list when I get home

The mini-BNC cable in the GSA kit is an adapter from the long coax to fit the RT350 radio which has a miniature antenna socket (similar to that on the A16/RT316 - I suspect the 350 predates the rest of the VHF manpacks in concept!).

To use the GSA you fit the spike on the bottom of the transformer unit (basically a 9:1 UNUN), stick it in the ground, connect the BNC on the transformer to the radio, and plug in enough elements to make an end fed 1/2 wave into the top of the unit. There were 2 foot and 1 foot elements - if you have one foot elements and they won't fit tightly in the top socket of the transformer unit you need an easily lost insert adapter (still available from gten98 on e-Bay)

The EKGSA comprises a masthead socket for the 5.4m mast which replaces the ground spike, a long medium or short "approximate quarter wave" patch lead and a choke that clips on the mast. Everything has nylon cord loops which must be hooked on to provide strain relief. The choke is just a few turns of small coax around a ferrite ring inside. I suspect that the antenna can be optimised by cutting a 1/4 wave coax section for the actual frequency in use - field reports I have heard 1st hand are that the elevated GSA works nearly as well without the choke and 1/4 wave on most randomly chosen frequencies !

I have used the GSA as my antenna of choice for VHF (it's the only one that isn't lossy!) and it will also work well down to 10m on HF given a bit of mechanical support.

Regards

Iain

Hi Iain

I notice the Pineapple works OK with a lowish SWR on 50Hhz and 70Mhz if you omit the top section! Haven't burnt one out yet.

Panorama do an expensive 1/4 wave groundplane for 70Mhz which would appear to have radials that are too short, just moving the coax makes the SWR wobble. Adding an EGSA 3 cable tie section of coax and the choke sorts it out! I wonder about using the EGSA with the 353 and whether it would survive 40 Watts!

50MHz is a bad frequency (rapid transition from inductive to capacitive) with all the elements in - I must try an EVHF on 50 without the top one !

From memory (it☐s a while since I had one apart) the GSA base has a 25W rated metalclad resistor in it so probably pushing it if mismatched

My observation is that the EVHF performs tolerably well on 145.

Any comments on the "match" please?

SHould it do better on 50Mhz?

729. 4W SURF

Yahoo group: Clansman351
Date: 2013-08-02 17:57:23 UTC
From: jwmyers93
Topic: 729 Message: 729

Hello,

I recently purchased a 4W surf for the radio.

First question is, how do you use it?! (I know what the unit is supposed to do, but I need some help operating it!) It was an impulse buy at £1.99!

Second is that the antennas don't fit into it. I have a whip antenna and a collapsible steel antenna, both of which fit the 351, but don't fit the SURF. It would appear that the SURF's antenna socket is the same shape, but is smaller than the 351's socket. Are there different antennas for the SURF?

Finally, are there any safety issues regarding the SURF? I am aware that it has a radioactive illuminated tuning indicator which is supposed to glow in the dark. (After testing this in the dark, it would appear that it no longer glows). From being in the cadets and working with the L85 with an Tritium illuminated SUSAT sight, we were told that if the sight cracked, we were meant to leave the sight/weapon in a well ventilated area.

You lucky so and so !, £1.99 !, the Surf normally fits between the set and the Turf or if you have the linear, between the set and the linear, electrically that is, coax from the set output to the Surf from the surf to what ever be it the linear or Turf, as far as I know that is, the Surf is used to stop transmissions from a near transmitter flattening the receiver being very selective, hence the name.
But I daresay other more knowledgable folks will come to your rescue soon.
Leighton. GW3FSP.

I've just checked my sectional whip antennae and it fits quite happily into the antennae socket on my 4w surf and the 351 socket.
Are you sure the whip doesn't fit the surf ?.

Leighton

Hi

The SURF4W fits on top of the 351 case and is electrically connected between the 351 and the 20W amp (in a 352 configuration) or between the 351 and the antenna (in a basic 4W manpack configuration).
Just connect as required, key the 351, and tune the thumbwheel knob on the side of the for maximum meter reading. Normally used where a pair of 352s are co-sited for rebroadcast use to prevent de-sensitisation.

Regards

Iain

Thanks for all of the information. I have checked, and my antenna socket is definitely too small. I have sent a message on eBay to the seller, gten98, who is the PTSNorfolk guy. He seems reputable, so I hope I get a solution soon!

Hi Troops,
the giveaway is that the socket on the SURF is like but smaller than the one on the radio.It seems that what you have purchaced is the SURF for a uk/prc350 which uses the mini-bnc to connect to the outside world when using the SURF or a Groundspike antenna..Still a bargain despite the fact it isn't the correct one for a uk/prc351.

Hi Troops,

the giveaway is the mini-bnc connector.This is only used on the uk/prc350 to connect to the SURF or to the adapter cable when using a Groundspike.The SURF is in any case only rated for the '350 but still a bargain bespite the fact it won't fit a uk/prc351 .

It is not a 350 SURF.

I have one of these:

http://www.armyradio.com/arsc/customer/product.php?productid=2274&cat=111&page=1

This is a 350 SURF:

From: gw3fsp
Topic: 737 Message: 737

Just had 6 "dud" NiCad batteries and 1 good un delivered, I don't think my postie likes me anymore!.
Discharging one of the duds now with a rather lage (and hot) resistor.
when It's finished I'll drill out the rivets and start dismantling it.
All the ones I've bought have the pop rivets holding the top onto the metal case.
Leighton. GW3FSP.

The metal cased batteries are the oldest generation. The newer ones are in plastic cases. I had one of those older batteries go up like a Roman candle having just charged it...take care!!

You will be pleased to know that is the easy bit!!

They may come to life with the IBMS, but they need some voltage to get it started

Hi Mike (and others) What I'm doing with these duds is replacing the internals with new 4Ah NiCad cells, I've found a source of dual packed commercial batteries with solder tabs on the top and bottom, I'll be replacing the diodes as well as I doubt if they will survive the strip down.
The battery I'm discharging was at 6.5 v it's now down to 3.1 v and the resistor is beginning to cool down a bit.
Once this one is more or less discharged I'll be cutting the connections and removing the cells.

The problem has been resolved. I showed it to another Clansman owner, and after comparing another antenna socket, it turned out it was bent. It was not enough to see on its own without comparing it. He gave me a replacement socket, and now my antennas fit it.

Down to 0.1 v this morning, after 4 hours the case is now empty, the diodes survived, one set tucked on top of the charging socket, the other buried in the center of the batteries, ho hum.
I'll check those diodes and see if they can be identified, if not it'll be 1n4148's most likely, so far so good!.

Date: 2013-08-08 21:04:46 UTC
From: gw3fsp
Topic: 744 Message: 744

Well, what a nice surprise!, gent I bought No4 rt320 from sent a carrier frame along with the antennae and handset, the carrier is for the 351/2 kit not the 320.
I duly fitted the full radio, surf and linear to it instead of having the kit stuffed in a bag.
Another little item, I bought some paint for the Clansman kits I've been collecting, and very good it is!, matches the original matt finish and the colour is Dark Bronze Green and is the correct spec.
The paint is BS381C-224 from Facinating Finishes.
I bought the aerosol for touching up, the official paint is a 2 part epoxy, mucho dinero !

745. Ground spike and elevated aerials

Yahoo group: Clansman351
Date: 2013-08-11 17:26:46 UTC
From: gw3fsp
Topic: 745 Message: 745

Tested the both aerials, some of the cables need repair so I'll be doing those shortly, as per usual it's the most used ones which have faults.
SWR is acceptable by adjusting the number of elements I'm using, being the short rods it's a little easier.
Leighton. GW3FSP.

ERM !!
Apparantly this carrier will do both sets, well I tried and I could not work out how to fit the 320 to it!.
That's my excuse, and I'm sticking to it.
Bought the radio Bergen for the 320, I'll fit the set to a ply backbord and use it like that.

The 320 has 2 flat bars which screw to the radio and then to the carrier. I did the reverse, took my 320 off the carrier and mounted my second 351/2 on the carrier instead

Hi George, I've sussed out why I could not fit the 320 to the frame, the 2 flat bars were fitted to the radio in the wrong places, OOPS!, I didn't think they were as they were screwed onto the 320 when it arrived here.

From: Iain Moffat
Topic: 749 Message: 749

Dear All

My clansman and radio website at www (dot) g0ozs (dot) org has been identified by google as containing malware and appears to have been hacked to upload a booby trapped index page at 06:54 on 13th August. It would appear that there was an earlier upload by someone other than me on the 5th of August which correlates with a virus infection on my PC at home. Probably it succeeded in exfiltrating FTP credentials stored in filezilla client which I used to use for FTP. The malware is correctly identified by windows defender but anyone who has visited this month.

I will of course be changing all my passwords today and I will delete the site content until I have time to re-upload a backup. Anyone who has visited the site since the 5th of August is strongly advised to run a virus scan for what was identified by Windows Defender as Trojan:Win32/Quidvetis.A

Sincere Apologies

Iain

Battery No1 now finished, changed the diodes as well, 2 pairs of 1N4148's in series, fitted new battery contacts as well, now on charge with my DCCU at 27.5 v and going up slowly, any idea what the final voltage is supposed to be, or is the charge stopped when the temperature difference hits the mark?.

Battery No1 now finished, changed the diodes as well, 2 pairs of 1N4148's in series, fitted new battery contacts as well.
Hi Mike
Cost of dud battery £3, contacts 50P, diodes from stock, 4Ah batteries £41.40 for 10 packs inc vat. Time and effort - free.
I now have a fully charged 320/351/2 battery good for a few years.

Not bad, considering what the manufacturers charge for a new battery.

For a while the Military we rebuilding these batteries.

Yahoo group: Clansman351
Date: 2013-08-29 14:20:45 UTC
From: gw3fsp
Topic: 759 Message: 759

My Clansman light weight 5.4 metre mast kit is on the way here, so hopefully before the sun disappears for the winter I'll be able to wander off to the top of one of our local mountains and have a play with the 351/2 kit and maybe the 320 as well.
All good fun innit !. the joys of being retired (hah!)

Hi Robin

Yes, something like that, but without lots of the cables at the moment.

Also no intercom kit.

Also, one of the 353's needs fixing. I think it's a power supply problem.

Hi Robin

It's a 1980 Lightweight. Currently British Racing Green, but will be painted NATO Green and Black - maybe not this year though

Had it since 2001. Iv'e got the radio table and a selection of Clansman radios to go in.

Hi Robin

Yes, it's a 24V FFR. Got it from Craddocks in Cannock, and look after it myself.

Not had much trouble with it apart from the condenser went twice. The second time I didn't get the 24v one, just fixed another one I had my garage that fitted safely.

It's never failed an MOT. Shame they don't do over 60 mpg like my Bluemotion Golf does!

Oh yes, recently had to do clutch hydraulics too.

Also got a Sankey trailer for it.

Regards
Terry

Hi Terry

Wow 60mpg would be good! 17 on a run normally, but now I have an aged and noisy Fairey Overdrive and get about 20!

Hi Robin

I get about 17 too. Overdrives are not cheap or easily available now, and as I only do a few tankfuls a year, it's probably not worth the investment to get the extra 3mpg.

I also have an old Disco that does 32mpg. (300tdi.)

I have just rejoined VMARS in order to get some 353 info in order to try to get mine broken set going again.

Subject: Re: [Clansman351] 351/2 Kit

Hi Robin

Yes, something like that, but without lots of the cables at the moment.

Also no intercom kit.

Also, one of the 353's needs fixing. I think it's a power supply problem.

774. 353 transceiver

Yahoo group: Clansman351
Date: 2013-08-30 22:36:18 UTC
From: gw3fsp
Topic: 774 Message: 774

I've had an offer of a 353 set, is it worth a play ?, what's it like for servicing?, any particular problems cropping up with them?.

Hi Leighton,

From an operators POV you should enjoy it. It has some interesting mechanical features and if you just want an anchor then it should hold a medium size boat steady in a gale (the sound of which you can generate with the fans:) As the fans are there to cool the valves turning them off may be a hazardous technique -

Should keep the average shack warm with both its direct heat output and convection.

I am talking from the POV of a military operator. Having never operated one in the radio shack I would be interested in any comments about the operability of the set in amateur radio. I have refrained from purchasing one because of the above but I will buy one at the right price for posterity while I can still lift it. - Great for military re-enactors and collectors.

Fifty Watts is handy on 4m and 6m, as are the low power settings.

Regards,

Stu

Leighton, Stuart

I have a couple of them which I like – if untouched they are good reliable sets if you have a sufficient power supply (3A RX 12A TX) – the main Amateur limitation is the 25KHz channel spacing which does not fit well with the band plan; Adam is correct that unless you want to integrate with an AFV harness or a DMU/IBRU secure rebroadcast system there is nothing other than an extra 20W of power to show for the size and weight difference compared with a 352. Graeme at PTS Norfolk (gten98) has spares at the sub assembly level.

Regards

Iain

Thanks for the info guys, this set would be for shack use only, I have a 28v 42 amp supply here I use for my Collins 618T, it also powers the R210 and 321 sets I have here with no problems.
I shall have a quiet think, the extra power on 4M ould be usefull, as for 6M I have a BNOS 100 Linear I use on that band which this 353 would drive quite happily.
Leighton. GW3FSP.

You need to "off" the squelch tone otherwise Hams moan about the 160hz if they are on "Civvy" rigs! But I use the one in my Landy on Sunday morning net in the Portsmouth area (0900L 70.325Mhz) and I have a couple in the shack, all from Gten (PTS)

Hi Robin

Is it easy to off the squelch tone?

I have two of these radios, one seems ok, but the power supply on the other one seems dodgy.

From: gw3fsp
Topic: 791 Message: 791

The mast kit has arrived, duly inspected, fascinating !, wish I'd bought one of these years ago for portable working.
The bag went straight in the wash it was really grubby, came out looking considerably cleaner !.
The kit also had the long wire antennae reel for the 320 included, didn't expect that, fits on the top pole.
Now find the instructions I have somewhere to put it up in my back garden for a practice run with the 320 and 351/2 kits.
The 353 is on it's way so more play later, probably have to go shopping for the tuner system for it, although I do have a VHF tuner here I use for 4 and 6 metres I could use with it to see what happens, at least according to the manuals I have now it seems the PA is well protected against mis-matches.
What fun it is to be retired !.

Update 3rd Sept
A very, very heavy box has just been delivered, my 353 has arrived, looks very clean, usual dings and scratches where the carrier fitted but so far so good.
I will report later when I've put my neighbour's laptop back together.

Managed to have a quick test, rx works ok all 3 bands.
Tx only works band 3, I noticed however the tx afc is well left of centre at the bottom of band 3 at 56Mhz.
I will presume some tlc is required for the tx to fire up on bands 1 and 2, probably needs re-tuning on the tx side.
Power out on band 3 is excellent, it's higher than the basic spec with over 50 watts at highest frequency 75.950Mhz.
Hour meter shows 1020.8 hours, and the fans sound a bit rough, when I get time from my other projects this set will be opened up and given some tlc, probably a good cleaning for the air passage and fans with a drop of oil for the fans and turret mechanisms.
So far so good.
Leighton. GW3FSP.

Hi Jim, presumably these lamps are 24v?, not having any time yet to delve into the interiour of the 353 as yet can you tell which type of lamp they are?, all sorts of lamps are available from various suppliers I have contact with, maybe somthing could be re-manufactured or modified to fit there.

Hi Troops,
even the Ministery managed to see this one coming.Speak to PTS Clansman in Norfolk he has/had the solid-state replacement.This is a retangular block of plastic with l.e.ds potted into it and is a direct replacement for all the frequency indicator bulbs in one hit.No dropper resistors are required.I have no connection with him but always had a goodeal there in the past.

Hi Troops,

the MOD came to the same conclusion in the end.What they did was to have an l.e.d module manufactured as a drop-in replacement the module is 3mm 8mm and the same length as bay holding the lamps.The l.e.ds are spaced as are the bulbs so it can't be inserted the wrong way round.They are/were available from PTS Clansman in Norfolk and dont need any limiting resistors as they seem to be built into the module.Only 2 pins one marked with a + and the other -,couldn't be simpler

799. Re 353 Transceiver

Yahoo group: Clansman351
Date: 2013-09-08 13:14:56 UTC
From: gw3fsp
Topic: 793 Message: 799

After 3 hours on the bench my 353 is now up and running on all 3 bands, I decided to give it a quick internal once-over to see if I could find out why no band 1 or 2 transmit.
After uncasing it I had a quick scan inside, 3 motors and various geartrains found so a little oil applied to the bearings, gears and motors.
Powered up on band 3 and re-tuned the tx local osc to get the afc centred top and bottom of the band, dialed up 30Mhz, the rx turret chuntered away, the tx turret didn't !, spun the worm gear on the end of the motor a few times by hand and away it went, slowly picking up speed then stopped, tx worked but afc way off to the left, re-tuned band 1 afc, dialed up 41Mhz tx turret picked up speed a little quicker this time, re-tuned the tx afc then dialed up 55hz and re-tuned the afc there.
Then spent a few minutes tuning up and down the 3 bands with the Mhz dial getting the tx turret working, a little more oil on the motor and the drive system seems to have done the trick, the turret now clicks around quite happily, checked the power out on the top and bottom of all 3 bands and adjusted the maximum power to 55 watts, the 1, 15 and full power settings are now just over the figures given.
All now cased up and ready for my next project.

Just ordered 2 of the light clusters for the 353 dial illumination, they are available but not on the PTS website yet, I emailed them and they were found in stock.
When I next get a chance to open the set up I'll see how these clusters fit, and have a go at fitting one.
Checked the set again and it still works.

From: gw3fsp
Topic: 793 Message: 801

Parts I ordered for the 353 have arrived, I thought I'd buy them in case the fault I had on bands 1 and 2 proved terminal.
As it was the fault was cleared with a little tlc and and a few drops of thin oil, the parts I ordered were - the TX turret assy and the RX turret assy, And that's exactly what has arrived, the Complete TX turret and transmitter assembly along with the RX turret, rx and the ht power supply which apparantly are matched units.
If any of you have problems with your 353's rx and or tx I would suggest you grab a pair of units as spares.

802. DCCU

Yahoo group: Clansman351
Date: 2013-09-15 12:26:20 UTC
From: gw3fsp
Topic: 802 Message: 802

Just had my 14v DCCU open to have a look inside, the 3 pots needed to adjust the charging parameters are all accesable on the control card.
The charge current on my DCCU was set at 1.25 Amps, this I have now reduced to it's minimum of 500Ma using R11, I also reduced the output voltage to 29.5V using R26, on test now with one of my old working batteries, the case temperature of the DCCU has also decreased rather dramatically !, battery is now showing 28.5v and slowly creeping up.
I'm hoping this reduction in charge current will increase the life of my batteries, especially the re-furbs.

From: <jwmyers93@...>
Topic: 803 Message: 803

Hello,

I have a EVHF Pineapple and I am looking for the adapter that goes between the 351's BNC connector to the larger C connector on the coax. I have so far been unable to find this part. The only time I have seen one was part of the complete EVHF kit, but I don't want to pay £40 just to get the adapter! I did look on the PTS Norfolk website, but I couldn't find it. Does anyone have a spare available or know where I can get one?

Thanks,

Jack.

From: Michael Buckley
Topic: 803 Message: 804

PTS usually sell all the bits separately.
Try asking them

The heavy cable has an adaptor that goes onto a bnc cable via an
adaptor- I can sell you an adaptor, the bnc is standard both ends.

The Pineapple is usually OK, but could be OC, the three section whip can
often be oc at the bottom end which is actually a tripole and it is this
that is OC, internally.

Forgot to mention this, reducing the charge current will also reduce the internal temperature of the battery under charge, this will probably stop the diodes from correctly signalling the charge state and will not trip the charger off.

Thanks for all the replies.

Thanks for the link George, I did see that but I did not think it was the right part for the set at the time. The only pictures I have seen of it were in complete antenna sets, where there was no close up view of the part. It looked different because it has the metal plate in the middle with the connector dust caps on.

Hello,

I have a EVHF Pineapple and I am looking for the adapter that goes between the 351's BNC connector to the larger C connector on the coax. I have so far been unable to find this part. The only time I have seen one was part of the complete EVHF kit, but I don't want to pay £40 just to get the adapter! I did look on the PTS Norfolk website, but I couldn't find it. Does anyone have a spare available or know where I can get one?

Thanks,

Jack.

From: gw3fsp
Topic: 811 Message: 811

Tested the 353 yesterday on 6m and 4m with a friend in the village here, running 100mw, 1 and 15 watts and all ok, speech quality better on narrow mode so I was told.
I need a headset though for this set, the handset gives feedback very easily if the audio is turned up just a little too high.
More shopping to do.Again !.
Leighton. GW3FSP.

Buy lots of cheap audio gear - and the occasional new one. The cheap stuff you can use for repairs. There are cheap spares about so you should not have much difficulty making up audio gear. The audio gear staff user is more robust than the B vehicle headset I find. There are lots of cheap pressel boxes about.

Hope this helps...

Regards,

Stu

Hi Stu, already sorted, just bought a load of headset bits from a member to save them from the skip!, should be able to make up one or two out of the box full.
The 353 by the way is now working well after my TLC with the oil can, good old 3in1 does work !, just very lightly oiled the motors, gears and shaft bearings on both turrets and the cross shaft and away it went.
The side tone is via leakage from the TX to RX so it cannot be adjusted probably why I get feedback using the handset.

HI,
Thought i would get a Surf unit for my 351 set.....it tunes okay as
it should do being new looking
but what is the spring loaded lever above the tuning knob for ???
engraved Press it does not appear to do anything apart from stopping the
tuning knob from rotating when it is held down
must be missing something i think.....do i need more water in my Whisky
??

Okay Mike,
I did at first think it was to release the cover over the meter.....how would that press lever work then were the operators expected to hold it down whilst on the move. my tuning knob is quite firm when i go to tune it anyway so doubt if vibration would detune it.....or should the lever lock in the down position ????

In the rough and tumble of military life it was easy to detune without the lock.

818. RE: 353 Transceiver

Yahoo group: Clansman351
Date: 2013-09-23 13:43:42 UTC
From: <jwmyers93@...>
Topic: 811 Message: 818

I think you've been confused. All that lever does is stop the tuning wheel turning once it has been set. Hold it down to tune and let go of it once you're done so it locks.

You may struggle to tune it if you're pressing the lever down too hard as it rubs against the top of the tuning wheel. Push down gently so the locking pin moves clear of the tuning wheel's teeth, but not so the top of the lever is touching the top of the tuning wheel.

Pushing against the bottom of the tuning dial cover will flip it open.

Hope this helps,

Jack.

HI All

Jack is correct. One thing to watch is that the tuning on the 351 SURF is quite sensitive . If I remember correctly is you are tuned already to 51Mhz and you want to retune to 70Mhz then you turn clockwise on the 4Watt SURF. In partice for amateur use the SURF is really not needed. I leave the SURF's on the set so I don't mis-place them but never use them J

Cheers

826. 353 Transceiver dial lamps

Yahoo group: Clansman351
Date: 2013-10-03 17:16:37 UTC
From: gw3fsp
Topic: 826 Message: 826

Now had a chance to look at these lamps, there are 4 mini wire ended lamps about 4mm diameter.
They fit snugly into a plastic former fitted with 2 screws on top of the dial unit, wired in series so I would think they are 6v minimum, with a supply which could go to 28v with a battery on charge with engine running I'd fit a series resistor to reduce the voltage on the lamps anyway, as for led's instead of lamps, with a foreward voltage of about 3.0v at 20Ma each led I would guess a series resistor of 800 ohms would be a good starting point allowing for a maximum 28v supply.
What do you guys think. Leighton. GW3FSP.

Update.
The LED's have arrived, these are 3mm, 4volt 20Ma (max) white leds, I also have now some 15v wire ended lamps to play with, I'll see what the led's do first with 4 in series with a resistor or two, to limit the current, the lamps will be tried in a series/parallel circuit to give 2 lamps in series (30v) twice, we shall experiment !, never a dull day !.
Leighton. GW3FSP.

828. Re- 353 Transceiver

Yahoo group: Clansman351
Date: 2013-10-10 14:45:24 UTC
From: gw3fsp
Topic: 828 Message: 828

The ARFAT and TUAAM have now arrived for the 353, I can see I need 3 coax runs with BNC connectors for the antennae, what length run is allowed for the feed to the tuner from the ARFAT, it's a 7 pin connector between the 2 units, and what's allowed from the 353 to the ARFAT, 2 different connectors there from the 353 to the ARFAT.
I presume the 7 pin connectors are the same as for the headet?.
Leighton. GW3FSP.

Leighton

The 7 pin between TUAAm and ARFAT requires only 3 or 4 wires so I think any audio cable with the right ends will do (but not vice-versa!). The TUUAM and ARFAT can be widely separated (all the ARFAT is is a switched attenuator to protect the TUUAM from high power while tuning) but the TUUAM is ideally directly under the antenna base. Note that the TUUAM needs a specific antenna base with a cylindrical adapter containing an UnUn transformer as the coax to monopole transition, and is designed to match a 2m rod in a No. 31 base

As an aside the TUAAM is actually part of the same RACAL family as the 351/2 (with which it can be used with an initiate box to key the TX and send a TUNE command to the TUAAM) and was not really designed for the worst case power levels of a Marconi 353 - 50W rather than 25W of a 352) so the ARFAT is provided as a workaround.

Regards

Iain

Update.
I've just completed replacing the 4 lamps in my spare dial unit with 4 led's and a 2.2k resistor, looks good and it's more than bright enough to to the job.
I've not yet tried to access the dial unit in my set, that comes later !, too busy at the moment with 320 projects.

Update,
I have just sent Stu a revised modification detail for the led mod, and details of my replacing the lamp holder in the 353. Unfortunately I don't know how to generate a pdf file of these to insert the photo's in the right places, they don't make sense without the photo's.

Hi Julian, I've sent you an email with an extract of the section of the EMER dealing with the adjustments available within the DCCU.

The 14v DCCU can be used from a bench supply of 13.8v quite happily.

Hi there
One fault to watch out for. Some times the socket pins come out of the charger cable that is plugged into the battery and they remain on the pins of the battery socket. This results in an open circuit on the battery sensor terminals. The DCCU light stays green.
I recommend checking this first before going inside the DCCU.
Look at the metal contacts inside the end of the charging cable that connects to the battery and look carefully at the battery terminals to see if there is the remains of the DCCU charger cable still stuck on one of your batteries.
Cheers

Hi

I would second Steward's opinion on this - I came across same issue but there is another thing to watch - some new/newer batteries cannot be recharged by DCCU - they appear green/full or blow the fuses despite the battery being 100% excellent and recharge fine on mains supply (have few different ones for Clansman). It happened on 14->28 DCCU so maybe this is a specific fault? Batteries in question were plastic type 5ah or 4ah ones where metal 4h or small 1ah were good enough for 14->28 DCCU. By the way - it runs fine off 13.8V charger or even a battery and gets quite warm while recharging what is -I think a normal state.

Regards - Arthur EI7GMB

From: gw3fsp
Topic: 837 Message: 837

I have surplus to requirments the standard armoured cable outer for the coax and 6 way leads between the ARFAT and TUAAM units for a Landrover, it is in new unused condition complete with the fittings on both ends, I have removed the inner cables for use here at home.
Anybody interested please message me off group.
As you may have guessed I have now the complete kit for the 353 system, from the 353 to ARFAT to TUAAM including the wing box and the antennae base with the choke unit for the whip.
And no I'm not fitting it to my car !.

Hi Mike, checked through all the 353 EMERs I have here, some mention of the ARFAT and TUAAM in them but no circuits.
I will open the thing up and have a good look around inside, might just be a dry joint or broken wire.

Hi

I think in 99% they are a baby monitors and cordless phones around 49mHz. I can pick up at least 8 different ones in my location - some of them are "protected" with voice inverters or jamming noise what supposedly is filtered off at the receive unit - but still easily distinguishable as a baby monitor transmissions. Mostly they are 24/7 and overlapping one another.

As far as I know it's not possible unless the RF final is completely re-worked. I've heard something about swapping out an xtal to change the multiplication scheme will get you to 6M but the RF section is a sealed unit. You might be operating at a much higher level than I in electronics and I applaud you if you can figure it out because the radio has no ham radio use for me here in the good ol' USA. I'd love to be able to use mine on 6M!

The EMERs are in the VMARS archive. Helpfully they include a full schematic of the synthesiser. Unlike all other VHF Clansman sets the vfo operates at relatively low frequency and is mixed up to the final RX and TX LO frequencies with crystal oscillators on the top pcb in the synthesiser (I have a box of NOS spare PCBs somewhere for experimenters btw). Al G8LIT got as far as replacing the Xtals to shift it on to 6m but hit a problem with the PA/Filter module which was too well sealed to be retuned easily as far as I can remember

By way of encouragement RACAL did offer different versions of the PRC349
both in frequency and output power

Hi Troops,
the uk/prc349 as designed was built to operate in one 10Mhz section specified by the user.RF deck was changed for other sections of the 30-75Mhz band.They can be operated as they are by Cadet units but nobody else.To rebuild the RF section is possible but messy why not just use a uk/prc350 ? more oomph and designed to enable the use of an external antenna

Anybody here got info and circuits etc on the 349 sets ?.
Been thinking of trying to get them up onto the 6M band somehow.

As far as I know it's not possible unless the RF final is completely re-worked. I've heard something about swapping out an xtal to change the multiplication scheme will get you to 6M but the RF section is a sealed unit. You might be operating at a much higher level than I in electronics and I applaud you if you can figure it out because the radio has no ham radio use for me here in the good ol' USA. I'd love to be able to use mine on 6M!

The EMERs are in the VMARS archive. Helpfully they include a full schematic of the synthesiser. Unlike all other VHF Clansman sets the vfo operates at relatively low frequency and is mixed up to the final RX and TX LO frequencies with crystal oscillators on the top pcb in the synthesiser (I have a box of NOS spare PCBs somewhere for experimenters btw). Al G8LIT got as far as replacing the Xtals to shift it on to 6m but hit a problem with the PA/Filter module which was too well sealed to be retuned easily as far as I can remember

Steve Slack M0SLK may help you on this - probably modifiable to 10/6m

Got one 349 just out of curiosity and to keep the collection of Clansman bits

This is something I'd love to see. If I was in the UK and these were
plentiful then I'd play around with one, but I'm going to have to wait
until someone comes up with a procedure. I only have one 349 and I'd rather
not hose it up.

Is anyone up for designing and implementing a uprated PA\Filter Module?

Unfortunately I don't have the brains for that - but could see it might produce a usable result...and save some of those 349s from oblivion;-)

Update - now have the EMERs for the 349, been having a look through them, seems to use the same basic system as all the manpack sets I have here, with varactor tuning of the various oscillators for the rx and tx, 2 ways of doing this, 1/ - try reworking the set internals to move the frequency up to 6 metres, or - 2/- make a transverter to move the frequency either up to 6 metres say using something like a +10Mhz shift, or down to 10m, next step I think is to get myself a 349 kit and peruse the internals.

When you get a 349 you will be pleasantly surprised as it is mostly plug in modules rather than soldered cans. The significant difference from the 350/351 in the 349 is that the synthesiser operates over a 10MHz range at a low frequency and a pair of Xtals select the shift up to the correct TX and RX LO frequencies so the band selection is relatively easy by changing the xtals (as Mike B pointed out they were sold for any 10MHz band in the military VHF range and the difference was the TX and RX mixer xtals and the PA). The PA module is more problematic mainly for mechanical reasons because it is sealed after tuning so cannot be easily modified. From memory it is a simple 2N3866 single stage and diode T/R switch with a band pass filter. As it is a plug in unit replacement may be entirely feasible especially using modern SMD parts.

Regards

Iain

Hi Iain, thanks for the info, your jpegs seem to have vanished, I assume they were stripped off.
I had heard the xtals were the easy part !, when I get the set I will have a better idea as to whet I need to do, xtals I can get easily enough, what to do with the pa module I will have to wait till I can get my hands on a set, depends on how it's sealed, probably by soldering the can on a base plate or whatever, still, it will be another project for me to play with in the long cold winter nights!.

Bin thinkin' (always dangerous) Why 6m?

Would Ten FM or 4m not be more useful?

I do hear stations of 4m. This makes my 351 ultimately very useful, You do get dx on 10FM and occasionaly a QSO in range or via tropo.

(I realise the repeater shift and CTCSS might be a step too far at this stage in the project;-),

What I don't know is of any FM activity on 6m - correct me if I am wrong.

A 220Mw FM rig on 6m while a sound technical achievement for a collaborative project - might therefore be a bit of a limitation.

Perhaps the mod should be one of choice 10, 6 or 4m. This will mean a different approach, wideband PA and or switchable filters and choice of bands (The mode switch being the target switch).

Maybe the great egg race could turn this into a challenge and therefore a competition. Anyone willing to donate a prize or contribute?

;-)

Regards,

Regards,
Hi Stu, This idea of mine has just come to mind, I'll have a look at 6m first, around here 6m FM is used quite a bit for local qsos,and small 6m linears are about to boost o/p, as are ex Pye mobile linears for 4m, untill I get a feel for the set and work out what I need to do to shift the set I am not comitting myself to anything!, IF my idea works and I can get the 349 up to 6m than I daresay other bands such as 10m and 4m would be looked at, but not yet, as with the other work I've done on the 321 and 353 sets this is purely for my own interest, if it works it will be published, and the word is - IF - .

From: Greg Smith
Topic: 870 Message: 870

Hi Group,

a minor off topic, the 349 will go on 40.675, which is within an LPD allocation. If that isn't enough, the RF out can be reduced internally very easily, so compliance with IRxxxx shouldn't be a problem. Of course, QSO's will have to be arranged... Aside from that, I'm pretty certain the Spanish 349 is built on 50 MHz. I think it's called a BCC349B or something like that.

greg

If sending document attachments to me, please consider using a format such as PDF, ODT/P/S etc, if possible. Thanks!

Hi, I am currently waiting for my 349 to arrive, When it has I will be delving into it to see if I can shift the set onto 6m, then onto 10m, I have also bought some spare oscillator modules for the 349 to play with.
IF I get any luck I will post my results.

That would be excellent. Thanks for the reply. Keep me posted. I love the size and portability of the unit. If anyone knows the headset pin configuration such as which pin is ptt, which is audio, which is mic, that would be great. I would like to set up a speaker mic configuration to work with this unit.
Cheers

Hey Mike, thanks for the info. I found it under the "clansman" headset pinout as you said. Thanks again!

Pin out is the standard CLANSMAN Headset, 7 [in.

Detail in the AUdio EMERS available on the VMARS manuals web site, and
of course elsewhere

My 349 has arrived, really did not reaise it is so small!, Cleaned all the unit stickers off the case and gave it a wash!, looks better!.
After I have done a quick test of the C12 I have been working on for the last few days I will have a look at the EMERs and see what this teeny little thing can do.

Hi there

One Issue with the PRC349 is that the Tx PA would need major modification to operate on 6 metres. This does not seem practical So far I know of no one who has come up with a practical modification for this unit.

Cheers

Hi Stewart, this is one of the reasons I bought the 349, I also have spare PA and oscillator modules which I will investigate first, If a move to 6m is at all possible I will try it just to see if I can.
One reason I became an amateur is to experiment with radio and electronics which has been my employment and hobby for more years than I care to remember, the 353 can be shifted to cover the FM section of 10m quite easily, so why not try the 349?, might work, might not, but I am willing to try it.

879. Broken 14V DCCU

Yahoo group: Clansman351
Date: 2013-11-09 19:03:05 UTC
From: <jwmyers93@...>
Topic: 879 Message: 879

Hello,

I have a 14V DCCU which has just broken. After opening it I have found that there are two large components which have burned out. They look like resistors and are attached to the input socket. Does anyone know what values these are or if I can get replacements from anywhere? (If necessary I can take a photo of the components).

Also, off topic, I received a 351 amplifier from a friend and I was wondering what the 'T' position on the selector switch is for? Is it something to do with the TUAAM setup tuning?

Thanks,

Jack, M0HER.

Hi

As far as I remember T position stands for TEST if the amp is wired proprely and ok.

Hi Jack, Is the damage right alongside the 10amp fuse ?, between 2 diodes where the wires from the 14v input is ?, if so that is the RF filtering circuit which has cooked off for some reason, usually too high an input current, the fuse is 10amps but should be lower as far as I think as the dccu only takes about 5 amps when charging at maximum.

Hi Jack, one thing I did to my DCCU was to rewire the input side so the fuse and switch are before the input filtering just in case of problems as I have seen this burnup before on a 14v DCCU.

Thanks for your replies.

Yes, the burned out components are where you described they are, just underneath where the 14V supply comes in. What are the components and what values are they? Can you get replacements?

Thanks,

Jack.

Thanks, Jack.
Hi Jack, I will open up my DCCU tomorrow and take a look at what the parts are, I believe they are a pair of chokes to stop RF going down the supply lines outside the DCCU.
I'll post a picture of what the parts are and see if I can ID them.

Thanks, Jack.
Hi Jack, I have put a photo of my DCCU in my folder, the 2 items burnt out are wire wound chokes in the dc input wiring to the DCCU, they are wound on what looks like a fibre or plastic former, I would think any choke with a decent current capacity would do there, I will have a look in my suppliers web sites and see if they have anything similar, or, you could wind a couple yourself on say a 1/4 inch X 1 inch former.

A rather large parcel arrived this morning (at 8-30am !) with a Wide Band VHF Antennae kit inside it, I think it's called the Pineapple?, Came with - The base assy (a realy heavy lump!), 3 rods (1 thick 1 thinner and 1 quite thin) A length of heavy coax, a thin coax, and a C type to BNC adapter, In 2 bags, According to the CES list it is complete, and appears to fit on the top of the 5.4 metre mast I've got.
Apart from the 351/2 sets can this be used with my 353?.
Presumably it does not need the tuner.
Leighton. GW3FSP.

Hi Leighton

I use mine from the VRC 353 with the thin coax. The SWR comes down from about 2.7 to 1 to about 1.7 to 1 mine if I omit the top section!

It was meant for use with all VHF sets including the 353 (hence the heat sink to absorb nearly ½ of 50 watts) although there are some frequencies where it is a spectacularly bad match and full power is best avoided ☐ when I investigated one with an antenna analyser with all three elements fitted it has a major impedance discontinuity around 49-50MHz. The three elements form an asymetric sleeve dipole and the circuit inside the heatsink comprises a LC matching network and an attenuator designed to reduce the reverse power from residual mismatch by about half.

I did have a web page on the EVHF ☐ I was going to wait on doing some updates before reinstating www.g0ozs.org/clansman <http://www.g0ozs.org/clansman> but I have uploaded it here meantime

http://www.g0ozs.org/clansman/EVHF/index.shtml

Physically the base spigot will fit a 5.4m mast but I think it☐s too heavy given that the 5.4m is a 3-guy mast and cannot be raised single handed with more weight than the poles themselves will tolerate unsupported. With the bottom 3 sections it is possible to walk upright for test purposes if the bottom is secured

Regards

Iain

Hi Troops,

yes youcan use it with the '353 but it it is a bit lossy.Also the thickest section of the antenna is prone to failure and as memory serves me it isn't just a straight conductor.Iain g0ozs did a very good piece on this antenn and its foiblesDO NOT use the 5.4M mast with this antenna,it is too heavy,having bee designed to be used with either the 8 or12M mast.On one of the occasions when I saw it done one of the rigging pary only just escaped serious injury when the guying failed.

Stewart

Certainly I have done it - it's a lot lighter than EVHF. The main problem I found was making sure none of the BNC connectors were under strain and likely to be intermittent contacts. If only because it is somewhat optimised for the frequency in use by choosing the right number of sections the GSA is actually one of the more efficient Clansman antennas - the VHF Antennas technical description EMER even credits it with gain (although it doesn't say what the gain is relative to)

Stewart

If correctness is less important than working well, and there is surplus coax, you can actually just coil the spare coax as a choke ¼ wave (allowing for velocity factor around 2/3) down from the antenna base to get nearly the same result without the multiple BNC connections

Hi Stu et Al

I use the □Pineapple□ with the VRC 353 using, as I have said, 2 sections, I bought a bundle of thick sections which had been stored thin end down and had been sitting in their own condensation. I managed to clean most of them so there was good continuity between the centre conductor on the fat end and the slightly recessed bit at the thin end that the screw in centre section mates with. It rusts easily. The unsuccessful ones are destined for gardening duties! 2 sections because they had a better SWR at our frequencies than 3! I got fed up with hoisting the heavy thing up by hand(wearing a Miners Helmet just in case it Jumped out) so I bought a 4 Meter Panorama ¼ Wave Ground Plane ant from MLS. I was a bit surprised to find that the SWR wobbled around when you waved the feeder around when it was at the top of the8 Meter mast, Ground plane elements too short I suspect . I cured that by using the wierd looking inductor unit from the EGSA Kit, works like a charm with the correct section of Coax and doesn□t seem to mind 50Watts! Not particularly worried about 6 Meters, pretty dead around here(Guildford) and the Wing Box antennas work really on 6 and 4 meters anyway. Range from the Landy at Hindhead (960 ft) on a normal day produces QSO from Bognor, Reading, Portsmouth(20 Milesish) and sometimes Mid Wales and Taunton(80 miles) if it is Lifty. To be honest 4 meters is pretty average, it does not defract over hills well and the military would have been much better off with 2 meters!

Robin

Hi Robin et Al

I guess I won't put my 9 element 2 metre yagi up in the 5.4 metre mast or it will be an inverted "U" mast with the yagi on the floor.

It is only anecdotal from my perspective and I find 2 metres is better for stuff from high hilltops. Maybe its because there are more folks around to talk to .

4 metres is a bit like a desert up here in the north of England

Cheers

Adam

I have put the EVHF page back on my web site now having had to delete and replace after a security issue in August.

If as I suspect the lower fibreglass element is a sleeve dipole it will have 3 layers of metal embedded in the fibreglass

1) Coax inner from stud on top of pineapple to top end of fibreglass, connecting with top elements

2) Coax outer connected to pineapple outer contact and to outer sleeve at other end of fibreglass

3) Outer sleeve folded back over the coax outer and not connected at the bottom (pineapple) end

Unless they are relying on some transmission line method of combining (2) and (3) in one piece of metal

Someone really needs to saw up a broken one and see if there are 3 layers ..

Regards

Iain

Hi Troops,
yes youcan use it with the '353 but it it is a bit lossy.Also the thickest section of the antenna is prone to failure and as memory serves me it isn't just a straight conductor.Iain g0ozs did a very good piece on this antenn and its foiblesDO NOT use the 5.4M mast with this antenna,it is too heavy,having bee designed to be used with either the 8 or12M mast.On one of the occasions when I saw it done one of the rigging pary only just escaped serious injury when the guying failed.

Hi Iain, I think this design dipole was called a > Bazooka < fed dipole, I seem to remember years ago putting similar VHF aerials up for the Coastguard Lookouts for their 174Mhz Marine band sets, The aerial was fully contained in a plastic tube to stop salt attack, the coax feeding the centre of the dipole was fed up through the bottom section of the dipole, ground was connected to the top of the bottom element, the inner to the bottom of the top element.

Hi Troops,
yes it is in fact the Elevating Kit and Ground Spike Antenna were designed to go with the 5.4M mast and in a lot of circumstances will perform better than the "pineapple" (safer too!)

Hello again all,
if the correct cables are being used with the EKGSA they are fitted with nylon strain relief grommets with cord loops that slot into the mouldings between the set,balun and the ground-spike base.If the balun is loose on the mast remove the phosphor-bronze dend and refit,this should cure the"wobbly balun" syndrome,

For possible information, I understood it to be a tri-pole, fed from the top of the bottom section

For possible information)!)

I understood it was a Tripole, fed from the top of the bottom largest section - which of course fits what Iain has said.

Plenty of u/s ones about!

907. RE: Broken 14V DCCU

Yahoo group: Clansman351
Date: 2013-11-16 19:25:52 UTC
From: <jwmyers93@...>
Topic: 879 Message: 907

Hello again,

I have had a look at the DCCU and removed the two chokes as they were flaking to pieces.

To test the charger I jumped the space where the chokes were with crocodile leads, but it still does not work. I have looked over the circuits again, but I cannot see anything else that looks damaged. Does anyone know what the next thing to test is?

Thanks,

Jack.

Just started on another battery re-furb, got enough cells for 2 re-furbs so I thought I would get another one done while waiting for spares for my C12 set, half way through and waiting for the new paint to dry ready for the morning session installing the new cells and diodes, tried stripping a plastic battery, got the bottom off and decided to scrap the lot, foam was black and burnt, cells look as if they have been burning and the inside of the case has melted.
I managed to salvage the 4 way connector and that was it !.
My Pineapple aerial system has arrived, checked and tested and all ok.

Just about finished this one, completed apart from securing the top cover to the case, on charge it now shows 27.9v and slowly going up.
Noted about the mess, yes well stripping a metal cased battery does make a mess, but then I like making a mess!, and my Henry makes short work of cleaning it up.
Slight modification to this one, I included a 20mm fuse carrier in the battery positive lead with an 8 Amp fuse in it. Probably start on the next one tomorrow, still waiting for my C12 spares, and my 320/1 set.

Hi Robin
There were a couple of pallets of these new batteries for sale at Withams. I nearly bid for a couple of hunderd but thought of all that weight lifting them.
There is clearly a nice big profit for the buyer but he/she deserves it with the cost of going picking them up in a big van etc . loading an unloading.
Cheers

Hi guys.

For some reason eBay won't show me all the search results and its computer independant. Its worth to link some interesting items here I think. I am very happy with this transducer, works well and is miles ahead on comfort compared to this throat mike.
There are few very good traders around on eBay selling Clansman bits at DECENT price.
Another one would be http://www.ebay.co.uk/usr/lrseries-surplus They're a Land Rover parts specialists but Clansman bits are showing up on their listings from time to time.

Artur’s e-bay link has a picture that tells all – you could fit it with a hook or cord loop to attach it to a vest, to use as a speaker-mic but it’s really meant to be worn under a hat or helmet – you can key it while still over your ear but it works better when taken off and held in front of the mouth for transmit use. The same transducer is used for microphone and earphone so it is not (unlike the 349 throat mic) optimised for picking up sound conducted through the operator’s body.

I’m not sure which method was actually intended – the radios had a fairly effective VOGAD to control modulation level over a wide range of audio input levels so both ways will work.

Iain,
That's great thanks. I'm trying to make the setup with the prc-349 as compact and least obtrusive. Kind of like a current law enforcement arrangement, with the transducer clipped to my shoulder. I want to try using these while in the forest with my dog, and able to talk with family at home. I've always liked the 6m band. I figure if I use it on the old cordless phone frequencies, which were around 46.000mhz, I'll be safe from the unmentionables!
Cheers

Hi there

Red stripe over mesh indicates microphone insert - as a main purpose - but it CAN act as a speaker too. Green stripe over the mesh indicates speaker only and it means it won't be too good as a dynamic microphone (but will do to some extent). I haven't got a chance to try this transducer over to another amateurs as yet but "locally" it sounds ok.
Throat mike can reproduce the voice quite well. I did try it even with PRC320 with a moderate success. Not the best microphone with SSB but is "workable" and FM is more forgiveing yet still its a bit muffled and bassy - unlike as this transducer. All in all it is all a matter of someone's taste or comfort. Its good to take same radio tested with both to see which one would be more suitable.

With kind regards
Artur EI7GMB

Artur’s e-bay link has a picture that tells all – you could fit it with a hook or cord loop to attach it to a vest, to use as a speaker-mic but it’s really meant to be worn under a hat or helmet – you can key it while still over your ear but it works better when taken off and held in front of the mouth for transmit use. The same transducer is used for microphone and earphone so it is not (unlike the 349 throat mic) optimised for picking up sound conducted through the operator’s body.

I’m not sure which method was actually intended – the radios had a fairly effective VOGAD to control modulation level over a wide range of audio input levels so both ways will work.

Regards

Iain

Iain,
That's great thanks. I'm trying to make the setup with the prc-349 as compact and least obtrusive. Kind of like a current law enforcement arrangement, with the transducer clipped to my shoulder. I want to try using these while in the forest with my dog, and able to talk with family at home. I've always liked the 6m band. I figure if I use it on the old cordless phone frequencies, which were around 46.000mhz, I'll be safe from the unmentionables!
Cheers

Yes indeed. The analogue FM cordless phones were between 49-50MHz and 1.6MHz so they were duplex. There are still a lot of them in use.

Hello,
Yes, they were in that range. Bottom end was at 46.000mhz. I remember programming my scanner with these and listened for quite a few years. The other comm device in this range are the older baby room monitors.

My experience of these head/mics is that they were issued with the PRC349 to some units, although I dont know why.

They work fine so long as you press them against your head while sending, which is not difficult as the ptt is on top, as worn.

A very similar one with a 2 pin plug was issued with the PRC316.

From: ENSEMBLE G8UMX
Topic: 917 Message: 935

Hi Troops,

the Single Transducer H/S will work when head worn but I have found the results to be dissapointing>The best clue to the military's use is to be found in the Audio & Accessories T/S flip chart book.The device when tested as a microphone is held at a distance of approx 25cm from the mouth the results are much better used this way.The basic ide was to make the 5radio operator less noticeable.Counter productive really because people did tend to raise the voice raising their profile.That is the main reason why the Racal Secrette came into being.It used the same moulding as the H/S throat mic setup but with a modified plastic moulding to hold the boom mic.Flat and inconspicuous and very sucessful.They are quite rare but do still turn up on eBay from time to time.

Local green radio nuts all find the most convenient bit of audio gear is a Racal made unit which is a 349 earpiece and pressel but with a boom mic as opposed to the throat mic. The boom mic is slightly more discreet than the standard Clansman one.

Hi Steve.

Thanks, something new for me to acquire. Is this same condenser mic insert as in "warrior" headsets? Have one what I can confine for spares so might do a crude version of this.

By the way - when would you put up this 351 10m mod on your site? I got your kit for 320 too, as mentioned in eBay messages - might have to look at it to see why there is still a small bleed over on LSB, but at least 320 is fully workable on 40 down.

Thanks

If anyone is interested, I have just picked up some Clansman parts quite cheaply, VHF antennae base with choke and rods £21, TUAAM and wing box £15, and a hand crank charger £21, (plus carriage) keep an eye
out on your (least?) favorite shopping channel, I've picked up some very cheap deals there lately from Wellington in Devon.
Very helpfull guys there will help out if anything is damaged, I had a free replacement masthead inverted V unit from there plus the brackets which were missing from the resistor unit.

Hi there
Congratulations on getting a good deal and thanks for letting everyone know.
I just got myself an MFJ antenna analyser so I can relly set up the antennae on my Clansman gear (EK GSA and the inverted V for the 320 to be spot on)
It made a massive diffference getting mobile antenna spot on. Of course you can do this with an SWR meter but the anlyser makes it so much easier and faster especially in the car static mobile when switching around antennae for various bands
Being Scottish of vourse it was secondhand !
Cheers

Hi there

Welcome to the group! I am sure if you have a question some of us should have a good idea on where to get the right answer.

PS get a Clansman Bergen bag, they are much easier for the wife to carry then the heavy metal Bergens

On a well known site second hand for about £10 . I was lucky enough to get new ones a couple of years back.

When the weather improves I am going to do some meaurements on the GSA and EK GSA antenna with an antenna analyser and see what the SWR and resonance look like on the 4 metre and 6 metre bands. Unless of course has anyone else done this already? Advice would save me a task

Cheers

Robin, Stuart

I remember doing it for the GSA on the ground about the same time as I did the EVHF write up for my web site, but never got round to publishing anything. The GSA on the ground was good for about +/-5MHz from the centre frequency between the 2:1 points on my MFJ analyser at 50MHz

I never tried it elevated (the one time I did at GB2CRF I had a BNC cable go intermittent within a few minutes of putting it up and had no time to investigate further before the rains came) so would be interested to see what real difference the choke makes – Al G8LIT reported that in practical field use it wasn't obvious that it did improve the results !

I have BCC543 TUAAM and its absolutely fantastic piece of gear. Strongly recommended. Will cover 6&4 handling much more punishment than rated 20w. A bit of upper part of 10m would tune in too, but no high hopes there.
Hand cranked genny is nice as a collector item but charging up even 1ah battery is a road through (a lot of!) pain.
For BCC543 its handy to have an "initiate box" as it saves awkwardness with "manual" initiating box to tune in. This one quite often comes up on lrseries listings (not connected anyhow, just the place where I got mine).

Kind regards

Artur

The TUUAM was used with the RT353 as well (50W on high power) so is well able to handle more than 20W when matched - the only caution when doing that is that the 353 installation always tuned on reduced power - the ARFAT box used with the 353 was a switched attenuator (4dB from memory) that protected the TUUAM from carrying more than 20W until it had achieved a match.

As far as I can understand it the original design was part of the Racal - BCC range (so Tuuam plus Initiate is the first solution) and the Marconi 353 ended up with the TUUAM and ARFAT either to standardise the VHF tuner or more likely because Marconi's own VHF tuner didn't deliver (someone did once post a pic of a non standard 353 that was labelled TURF rather than ARFAT implying a manual ATU)

Thanks Ian, this shed some light on it again. On the box it says its 20w unit but for the tuneing purposes 2-4 wat max seem to be optimal. Above 10w BCC543 mostly got into difficulties and would not tune at all or with pretty bad match.

Tried up to 100W on it on 6m band into non resonant antenna and it carried on well apart from some minor warming up on coils but air spaced capacitors were far wrom arcing.

On 4m either resonant or non resonant antennas were served no problem with 25watts (my maximum here) but 2-4 watt were a necessity to get it into tune. On 6m it would handle a slightly more power but still the lower the better. On 10m just a fraction of FM part was tuneing and often it got into troubles spinning motors into endless loop.

Worth of mentioning its tuned band pass filter is VERY TIGHT. Maybe next time I'd take few shots off VNA screen. Apart from quite narrow pass it will cut off all the rest. Brilliant job again.

Artur

The TUUAM was used with the RT353 as well (50W on high power) so is well able to handle more than 20W when matched - the only caution when doing that is that the 353 installation always tuned on reduced power - the ARFAT box used with the 353 was a switched attenuator (4dB from memory) that protected the TUUAM from carrying more than 20W until it had achieved a match.

As far as I can understand it the original design was part of the Racal - BCC range (so Tuuam plus Initiate is the first solution) and the Mar coni 353 ended up with the TUUAM and ARFAT either to standardise the VHF tuner or more likely because Marconi's own VHF tuner didn't deliver (someone did once post a pic of a non standard 353 that was labelled TURF rather than ARFAT implying a manual ATU)

Subject: Re: [Clansman351] Re: Clansman Parts

I have BCC543 TUAAM and its absolutely fantastic piece of gear. Strongly recommended. Will cover 6&4 handling much more punishment than rated 20w. A bit of upper part of 10m would tune in too, but no high hopes there.

Hand cranked genny is nice as a collector item but charging up even 1ah battery is a road through (a lot of!) pain.

For BCC543 its handy to have an "initiate box" as it saves awkwardness with "manual" initiating box to tune in. This one quite often comes up on lrseries listings (not connected anyhow, just the place where I got mine).

Kind regards

I have a TUAAM and correct aerial base strapped to the hood frame of my Landrover with Jubilee clips and one earth strap to the frame. Less than ideal as he frame isn't properly earthed to the body but I have found the TUAAM will tune from one to four aerial rods on 6,4 and 10 metres; well the top FM bit of 10m at least.

Someone mentioned the Initiate box, no need to buy one they are very easy to make. The circuit is out there but at the minimum all you need is a permanent 24v feed to the TUAAM which is interupted to start the tune sequence.

With my GSA and the short aerial rods, using an SWR meter I found that it was best with 3 rods on 4m and 5 rods on 6m (51MHz). I think it was much better than 2:1, nearer 1.5:1 or less.

Does it not say something like this on the plate on the big adaptor lump?

(Or may be its on the green instruction card, few of which still exist.)

Mike,

The chart on my "lump" shows 4 elements for 30-53 MHz and 3 for 52-71, also 2 elements for 70-76 MHz. It is this overlap around our frequencies of interest that led me to do the SWR tests.

I have a nearly pristine instruction card/parts list with my kit if anyone wants a scan of it.

> If anyone is interested, I have just picked up some Clansman parts quite cheaply, VHF antennae base with choke and rods £21, TUAAM and wing box £15, and a hand crank charger £21, (plus carriage)

Just had these parts delivered (8-40 AM !) quick report on condition.
TUAAM was new unused fitted in the wing box also unused, Antennae base fitted to the wing box with 4 rods also new and unused.
Just tested the TUAAM on 4 amd 6 metres, works with my 353.
Also in the kit was a bracket and antennae base extension unit with a round fitting for the antennae base on the top, also unused.
The genny is used, comes with the accessory bag which was marked 351.
As I have the 351 initiate box I have the full kits now for my 353 and 351/2 radios.
All in all I think a very good buy,
Leighton. GW3FSP.

Hi

It was me. I know its not a "must have" part and pretty easy to be built, but I like to keep my setup as close to the original as possible. Specially when ancillaries like that are relatively cheap. Also I see no sense with constant 24V supply source - once its tuned in there's no need to keep it energized.

Regarding 10m operation - my box was able to tune in pretty narrow segment of 10m in FM part and that's it. Below [if I remember it well] 29.500 or so it just got into continuous loop spinning motors being unable to tune in but when manually trimmed it was still able to go resonant as low as 28.600. It wont tune in below, its not technically possible unless someone would replace coils / capacitors to give it lower resonant matching network, not to mention band pass filter and its significant attenuation in this range. Maybe its a good starting point for a project, but would have to have a spare TUAAM for such a butchery. Idea of having a 12-11-10-6 auto atu is tempting though.

Kind regards de EI7GMB

Topic: 960 Message: 961

Geoff,
The flexible wiring loom inside the 351 is not that fragile, and you may well need to open the radio at some point to adjust power, deviation, etc, so your call really: I've had them apart a good few times and not had one fail on me yet.
In military service, radios were repainted, in a fairly rough and ready manner, simply to make them look green, as opposed to shiny aluminium allow, etc (and because it is a military thing to paint anything that doesn't move!)
When new and in service, they were sealed and waterproof, enough to survive being immersed and most surplus 351's are probably still sealed, so should survive a good scrub to get them clean. More then that may cause problems (ie, pressure-washing that may drive water down the switch seals, etc)
 One point to consider if you do open the radio up, is that it is best not to do it in a damp/moist atmosphere, as you will inevitably trap damp air inside, which will condense out when cold, and cause possible damage to the innards. There is a complicated process of pressurising, and purging the radios with dry air, but in amateur usage a warm, dry room is usually good enough.

Hi there

The connecting cables which the bendy pcb type (the name escapes me as I write) become really brittle and are prone to failing.

The safest route is to mask it off and repaint J

You can occasionally pick up brand new main body cases, really cheaply, and I replaced the old case on one of mine and it looks really noce now.

I have not any NOS cases for a while. When I did it I was VERY VERY careful

Cheers

Hi Geoff, the flexiprint connectors are extremely fragile !, they are a thin plastic with the copper circuit printed on, if they break the only thing to do is replace them with ribbon cable.
As the plastic ages it gets brittle and will crack given the slightest excuse.

966. RT353 Fault(?)

Yahoo group: Clansman351
Date: 2014-01-17 21:35:25 UTC
From: derek.vanstone@btinternet.com
Topic: 966 Message: 966

Hi All

I have just joined the group, having recently purchased a 353 for use on 4 and 6m. Powered it up this evening for the first time but with just a short wire connected to the antenna. No intention of transmitting. All switches set as per the manual for using the set as a base station. Set frequency to 70.450 and switched on and a hiss heard but the frequency light does not stop flashing after 10 secs. The audio hiss seems to pulse with the flashing frequency light. Followed the fault 2 instructions in the manual and the meter stays in the left or red zone indicating a synth problem. The set was purchased as working on receive and transmit from a well know Clansman seller on the famous auction site. Before panicking and contacting the seller - any suggestions. I am loathe to open-up the set if it has to be returned.

Thanks in advance for any help.

Derek, M0JMV

The supply is 24vdc nominally, I use a 28v supply.
You will need at least a 10 amp if you intend to transmit.
But should work ok on receive with about 5 amps.
I suggest you retune the set to say 50Mhz before switching on, you should hear a motor running, then a pause, then another motor running, you might hear a clunking noise inside as the turrets turn, first one is the transmitter turret, then the receiver turret (if I remember correctly) then if everything sets itself the front lights will stop flashing and the set will work, check the synth reading, the meter should be more or less vertical.

Derek

Probably worth checking that the 24V supply has sufficient current capability - the 353 is around 3 to 4 amps on RX as I recall.

Assuming the supply is Ok then the synth is unlocked. Because the 353 is unlike other Clansman radios in construction (it has a mechanically driven turret for band changes and motor driven coarse tuning within bands, with some cards in a cage connected via edge connectors whereas all others use soldered connections almost exclusively) it is perhaps more vulnerable to transit damage - I sold one that failed the UPS test even if it could survive 20 years in a tank).

Without opening up the set there are some investigations you can do.

The turret has 3 positions - from memory 6 and 4 m are on the middle and top bands. It would be worth trying it on 30, 50 and 70MHz - you should hear the motor noise as the turret moves when you QSY and if it is stuck one position may lock.

It is worth checking all the positions on the diagnostic switch to see if it is just a synth fault or if other things are affected (the combination of faults may give some chance of remote diagnosis)

If you do open it the first thing is probably to re-seat the cards in the card cage.

Regards

Iain

Yes a 4m QSO should work - I regularly work G0EMK at Braintree on 2m at similar power levels after reading GB2RS which is twice as far in the same direction. I will need to get a bit of height on the antenna as I use a slim jim at 10 metres for GB2RS and only have a GSA for 4m/6m at this QTH ready for immediate use. A good reason to assemble the 4m slim jim now !

The synthesizer will lock with nothing connected to the antenna socket - the radio has to get locked before it can transmit so the failure is internal. If you do end up trying to fix the set I have the 353 workshop test kit in storage which includes the various test fixtures and extender cards which you are welcome to borrow. Graham McCreish at PTS Norfolk in Fakenham still has most of the spare modules in stock. My guess would be a bad connection or something mechanically stuck rather than a failure internal to the synth module however.

Regarding power-on behaviour the turret will only have any reason to move at power on if the MHz dial was changed to a position in a different band while the radio was off so what you report is consistent with the turret still moving.

I have no experience inside my 353s (so far none of them have expired!) - Leighton GW3FSP and Steve M0SLK probably have the most experience of 353 mods and repairs among the regulars here.

Regards

Iain

Hi Iain

It is a 15amp supply and I have switched everything else off. Have tried various frequencies but still no lock. I hear some motors when going from 50 to 60 say. Could have been dropped in transit! (TNT - thought that was an explosive!).

I see you are not far from me - Great Henny, just to the south of Sudbury. Would be nice if, when I get it sorted, we could have a QSO on 4m?

Regards

Derek

Derek

Probably worth checking that the 24V supply has sufficient current capability - the 353 is around 3 to 4 amps on RX as I recall.

Assuming the supply is Ok then the synth is unlocked. Because the 353 is unlike other Clansman radios in construction (it has a mechanically driven turret for band changes and motor driven coarse tuning within bands, with some cards in a cage connected via edge connectors whereas all others use soldered connections almost exclusively) it is perhaps more vulnerable to transit damage - I sold one that failed the UPS test even if it could survive 20 years in a tank).

Without opening up the set there are some investigations you can do.

The turret has 3 positions - from memory 6 and 4 m are on the middle and top bands. It would be worth trying it on 30, 50 and 70MHz - you should hear the motor noise as the turret moves when you QSY and if it is stuck one position may lock.

It is worth checking all the positions on the diagnostic switch to see if it is just a synth fault or if other things are affected (the combination of faults may give some chance of remote diagnosis)

If you do open it the first thing is probably to re-seat the cards in the card cage.

Regards

Iain

Subject: [Clansman351] RT353 Fault(?)

Hi All

I have just joined the group, having recently purchased a 353 for use on 4 and 6m. Powered it up this evening for the first time but with just a short wire connected to the antenna. No intention of transmitting. All switches set as per the manual for using the set as a base station. Set frequency to 70.450 and switched on and a hiss heard but the frequency light does not stop flashing after 10 secs. The audio hiss seems to pulse with the flashing frequency light. Followed the fault 2 instructions in the manual and the meter stays in the left or red zone indicating a synth problem. The set was purchased as working on receive and transmit from a well know Clansman seller on the famous auction site. Before panicking and contacting the seller - any suggestions. I am loathe to open-up the set if it has to be returned.

Thanks in advance for any help.

Derek, M0JMV

Thanks for that Ian. I will have a ponder before deciding what to do. I will be in touch when all sorted to arrange a QSO - I need to sort out a 4m antenna first! I know Melvin G0EMK but have not spoken to him for several years!

Best regards

Derek

Derek

Yes a 4m QSO should work - I regularly work G0EMK at Braintree on 2m at similar power levels after reading GB2RS which is twice as far in the same direction. I will need to get a bit of height on the antenna as I use a slim jim at 10 metres for GB2RS and only have a GSA for 4m/6m at this QTH ready for immediate use. A good reason to assemble the 4m slim jim now !

The synthesizer will lock with nothing connected to the antenna socket - the radio has to get locked before it can transmit so the failure is internal. If you do end up trying to fix the set I have the 353 workshop test kit in storage which includes the various test fixtures and extender cards which you are welcome to borrow. Hi Derek, looks as though either the pcbs have come loose or one turret not turning, remove the set from the case, 4 screws at the front, 1 at the rear between the fans, on the left side of the set (looking at the front) under the turret assy is a metal cover over the pcbs, remove the cover and re-seat the pcbs 1 at a time, replace the cover, lightly oil the gears and bearings on the shafts behind the turrets, and turn the gears by hand to get the oil in the bearings, then tune to 30Mhz and power on, the right hand turret should turn first then the left turret, when you change bands the turrets will turn again, band 1 - 30 to 40.975, band 2- 41 to 55.075, band 3- 56 to 75.975.
When I first had my 353 the left turret was stuck on band 2, a little oil and tlc cured it!.
When replacing the case make sure the rear fitting between the fans is in the right place or you will not get the rear screw to fit.

Thanks Leighton, that sounds fairly straightforward so I will have a go at that if the original supplier does not come up trumps. He has promised to sort it for me so I want to exhaust that avenue before tinkering, although I guess it would be good for the soul if I fixed it myself!

Best regards, Derek, M0JMV

What band were you " just thinking " of ?
It will be quite difficult on 50 and 70 MHz here in North England where us 352 operators are few and far between. Maybe getting the Clansman mast and at least the EKGSA up on. A high location along with a 352. My possibility would be on the a North Yorks moors or Sutton Bank.
Cheers

A Clansman event?
If there are a series of 352/351/353 operators up & down the country could they be set to "Rebro" & see if a QSO can be obtained from Scotland to the South? With sufficient coordination amongst this group's members it could be achieved...

Hello Guys!
I'd love to try to hook up from here in Ontario Canada, but I'd have to string together a whole bunch of 351 20 watt amps to make it! I could try on my 5 element beam and cross my fingers, and say some cheers!

Hi.

With standard PRC320 we could make it possible virtually anywhere linking HF and VHF. Nice to dream though....

Ha ha, well Stewart, I'll have to get cracking on a really good antenna system and some good power behind it, seeing that it's FM mode! Let's get a date sorted in a bit, and all try and CQ! I know there has been some chatter on this side of the pond of creating a 4 meter band but I'll have to look into it, as I don't believe there is anything official yet. I still have 52.525 Mhz on 6m though!
Cheers!

I think you should be able to get 50-70km in one hop using the inverted V (actually end fed half rhombic) antenna used for rear links if you want to rebroadcast. We tried 120KM from Ipswich to Surrey and failed with GB2CRF using 353s at 50W last year. Also, I think the frequency separation requirements at a single site for rebroadcast would force alternation of 6m and 4m hops even using the SURF with the 351 rather than purely 4m operation.

Licensing wise RAYNET groups no longer need do rebroadcast under a NoV (so presumably other amateurs would also not need one) but it may be worth looking at http://rsgb.org/main/operating/emergency-communications/talk-through-units-guidelines-for-use/ to determine the requirements for ident and attended operation. I guess the annual report mentioned could be published in Signal ;)

Technically multi-hop rebroadcast will work, the limiting factor is the transmit/receive delays adding up and the risk of both ends going to transmit without being aware of the other increases with the delay.

And congrats on the 2E0 since we last spoke, I think ?

Regards

Iain

Hi Ian and all
Yes good points. The latency of such a log chain of re-broadcasts would make communications very difficult.
I was lying bed before dropping off wondering about the licensing issue here too.
Can anyone in the group advise on how many hops using re-broadcasts the army used when the equipment was in service?
I agree on re-broadcast the best approach is using Surf's and 50/70 MHz split. In addition running the twin cable between the radios and getting physical separation will possibly remove the need for the Surf's which do attenuate the received signal.
I don't have one but there is a rebroadcast box to link either. PRC320 and/ or a VRC321 to a 351/2 and this could act as a good long distance backbone to fill in gaps. We need to check the licensing conditions before setting up this one. It could also allow our international friends to join the net. However I am now getting ahead of myself.
The way forward here is to take this a step at a time and start with two re- broadcast stations back to back and see how it works and build it up from there. Then try three and so on. In this way we can find the limit rather than try the whole Monty and most likely fail for the reasons Ian indicated.
Today it is 6C grey raining and cold here in North Yorkshire. I don't fancy being up on the exposed Sutton bank putting up a Clansman mast till it is at least 16C and sunny as I am getting soft as I get older. However, if we don't put stakes in the ground now, this will just remain as talk.
So , on the assumption that Wayne and me get our gear up to Sutton Bank . (look at a map and Sutton Bank is a high escarpment and the nearest town is Thirsk) then is anyone else in let's say 50km range and want to do a try out in the April timeframe.
My personal limitation is that we have an ice cream kiosk on the beach at Filey so if it's a nice day, I end up serving loads of lemon top ice creams :-)
Unfortunately summer is a busy time for the family.
Cheers

Hello VK2HAS here. If I was trying for maximum range with the 351 I would be looking at making a standard Dipole but mounting it vertical and up relatively high. When used this way they have an extreamly low angle of radiation, that way all of your radiated power is heading for the horizon. Simply make the dipole out of split speaker wire and use a 1 to 1 toroid balun at the junction then run 50 ohm coax direct to the set or the 20 watt amp. Attach the dipole high in a tree and secure the bottom via string to a peg in the ground, that way you can pull the coax off to the side, tune your dipole for best SWR at your desired frequency and away you go. These antenna work wonders for me. Try it, cost you pea nuts. I hope this helps.

I have one of the remote boxes here. Have used in on our nightly 40m USB net with 2 351 one hooked to a 320 in the radio room outside and the other 351 in the warm house with me. Not as good as internet remote but worked fine. Anyway would be game to try to link on HF with you and provide bridge across the pond if it all works out.
Cheers

I am up for this. Any rules? All clansman VHF Sets including antenners.

Planning will be interesting (or lack of it:).

What would be the aim? To cover JOhn O'Groats to Lands End (or the furthest point away in Europe?) Using VHF Rebro and Or Relay Messages? (Sets would need to be un-modded in respect of pilot tones of course.)

A database would be needed to plan this together with some path profiling when all the sites are in. Let see....

Starting from the top a 352 Manpack initiates a call into a Rebro on a high spot somewhere in the region John O Groats plus 25 to 100km. The rebro is using two inverted vee antenna which have a range in excess of 100Km each .....This links to a similar Rebro at a similar distance going south etc.

Rather than picking sites at random, picking the best high spots would be my strategy to determine the minimum number of rebros necessary.

REgards,

Stu

Military rebro, with 351/2's tactically would normally only have been one hop, to get over a major obstacle, or to link two nets, and then whip to whip, ie, GSA's.

Two hops was quite high maintenance with manpacks, but easier with vehicle sets, and there was always a trade-off between range and signal strength: ideally you'd go for a shortish hop, with a good signal to noise ratio, so as not to add noise to the rebroadcast audio. Either way, modulation and VCO noise got added, from each radio, so eventually sounded very hissy, even with strong signals. You also got odd effects from the varying 150Hz subtones beating and mixing.

Probably the best plan is to use the maximum power available, into the highest antenna, to reduce the number of hops as much as possible?

You will need SURF's to keep as much broadband noise from the TX out of the RX passband, as militarily, you would have used the biggest possible gap between the two frequencies, and 351/2's, even with the SURF de-sense quite a bit, needing quite large physical gap between antennas. SURF 4W's were cheerfully used with 352's, by peaking it on the basic 4w from the 351, and then switching the amplifier on: the needle pings, but otherwise it handles the higher power well enough. 353's are much better for rebro, with a lot more selectivity due to the turret tuners, and would have used whips on opposite sides of the vehicle usually with TUAAM's for added selectivity, or an inverted vee for a rearlink if HF was not available.

Linking VHF to HF needs strong signals both ways, and an operator manually doing the rebro into HF. (Not really a job for a 320, due to the VOGAD)

Alex

Here in the flat lands of East Anglia I get best results on VHF FM with “Slim Jim” antennas made from twin feeder which have a couple of dB gain over the dipole due to a lower vertical radiation spread – certainly I got an improvement of an S-point or so from distant stations when replacing a commercial “white stick” antenna with the Slim Jim for reading the local VHF news (GB2RS in the UK). Practically this has the advantage that it can be fed from the bottom end as well. I am working on a 4m and a 6m version and should be ready to share a design by Easter.

I would agree in any less flat environment the dipole may be better when there is significant vertical separation between stations and significant radiation above and below horizontal is an advantage.

Regards

Iain

Hello VK2HAS here. If I was trying for maximum range with the 351 I would be looking at making a standard Dipole but mounting it vertical and up relatively high. When used this way they have an extreamly low angle of radiation, that way all of your radiated power is heading for the horizon. Simply make the dipole out of split speaker wire and use a 1 to 1 toroid balun at the junction then run 50 ohm coax direct to the set or the 20 watt amp. Attach the dipole high in a tree and secure the bottom via string to a peg in the ground, that way you can pull the coax off to the side, tune your dipole for best SWR at your desired frequency and away you go. These antenna work wonders for me. Try it, cost you pea nuts. I hope this helps.

A Clansman event?
If there are a series of 352/351/353 operators up & down the country could they be set to "Rebro" & see if a QSO can be obtained from Scotland to the South? With sufficient coordination amongst this group's members it could be achieved...

Stewart,
Yes, much better to go for absolute maximum height and distance: 20W from a 352 into a 4ft whip, or even better a resonant GSA from the top of Snowden would go a very long way LOS (and it's got a railway!).

I can't immediately think of one, but there are plenty of intervisibility programs out there which will work out what's in the way, and you can usually get away with about 10% extra allowing for diffraction over a single obstacle.

Many (many) years ago now we managed Pen y Fan to Snowden with A41's (ie, same as a PRC-10), about 90 miles overall, initially with a rebro about halfway on the top of the range in between, slightly higher then Pen y Fan. This was with 10ft whips both ends (and a bit of walking about), and the same with the rebro pair of A41's, about 100ft apart.

 I was on Pen y Fan, and had already worked the rebro, as it set up, as i caught their tuning call, but when I called, I got a reply from the Snowden end, as he had tuned up on my frequency by mistake, and was still calling the rebro on the "output", rather then the input frequency. This was only about 1w on 45Mhz or thereabouts, with receivers that would give 20db for 1uV, so a lot poorer overall then the 352 would be. I think with the obligatory "Prior Planning and Prep" you could certainly work a very long way, maybe not Lands End to John of Groats, but a lot further then you would get on ordinary terrain.

Having started as GM1WCK in the far north I think you have two options – to use multiple hops between high ground or to follow the coast using unobstructed overwater paths where possible.

From my own experience north of Inverness I never had any luck getting to the South of Scotland on VHF – probably because there are several sets of high ground blocking the path between Slochd and Perth on the way south and could only work along the northeast coast round to Aberdeen across the Moray Firth), so I would suggest (also to avoid much mountain climbing) to rely on the unobstructed overwater paths across the Moray Firth from John O Groats to Peterhead and then down the east coast past Fife to somewhere around Dunbar to cover Scotland in as few hops as possible. This is also what the cold war microwave links did.

John O'Groats itself is at sea level with a ridge to the south – it's probably worth going a few miles to the South East to Duncansby Head (63 metres asl; grid ND 405 632) with a clear sea path to the South and South East. That should have a clear overwater hop to one of the small hills west of Peterhead and South of Fraserburgh. Mormond Hill would be ideal (230m asl) but the MoD got there first :(Windyheads Hill a few miles west (highest accessible 214m ASL, grid NJ851623) is accessible by road, with as good a view back to John O'Groats but more blockage South.

Peterhead to somewhere East of Edinburgh is probably too far (about 160-180km) for one hop over water with military antennas – with a yagi and more power possibly quite feasible. I suspect an overland hop to high ground near Stonehaven would be needed (as an aside when I first moved here the works radio club at Martlesham used to work Alan GM4ZUK based on a hill somewhere near there on 2m using 400W each end in flat conditions every contest). Somewhere west of Portlethen should be suitable – the road reaches about 150m near Rothnick NO 872 957 with a good takeoff to the South East. Another candidate would be Cheyne Hill NO 834 874 west of Montrose.

Going inland the first accessible high point would likely be the high ground near Tain. I used to operate /p at Quarryhill car park 200m asl grid NH751 812. That site can see the cairngorms and the highest easily accessible point on the A9 through the mountains is Slochd NH 834 258. An intermediate site near Inverness would be off the A9 at Mealmore Lodge 284m asl NGR NH 748 379 or Daviot NH 722 407. For the best site between Inverness and Perth it would be better to go off road courtesy of the Cairngorm chairlift and railway though ! Ptarmigan Station is at 1100m and NGR NJ 004 049 has a poor takeoff to the South – better to the Southeast. The peak is NJ 006 040. The next hop would need to be high ground north of Dundee and West of Arbroath – you can get to 199m on Dunnechan Hil near Letham at NGR NO 505 495 with good takeoff NW and SSE.

From either of these sites there should be a clear path across the sea east of Fife to somewhere between Dunbar and Eyemouth - Dowlaw Road around NT 834 693 or Telegraph Hill NT

855 702 or between Crosslaw and Lumsdane at NGR NT 876 687– and after that it’s over to the Northumbrians !

Hopefully these NGRs can be an input to those with path prediction software.

Having said that it’s going to be 4 or 5 hops to the border so I suspect that a pure VHF rebro chain won’t be viable, but human message passing certainly will.

I am up for this. Any rules? All clansman VHF Sets including antenners.

Planning will be interesting (or lack of it:).

What would be the aim? To cover JOhn O'Groats to Lands End (or the furthest point away in Europe?) Using VHF Rebro and Or Relay Messages? (Sets would need to be un-modded in respect of pilot tones of course.)

A database would be needed to plan this together with some path profiling when all the sites are in. Let see....

Starting from the top a 352 Manpack initiates a call into a Rebro on a high spot somewhere in the region John O Groats plus 25 to 100km. The rebro is using two inverted vee antenna which have a range in excess of 100Km each .....This links to a similar Rebro at a similar distance going south etc.

Rather than picking sites at random, picking the best high spots would be my strategy to determine the minimum number of rebros necessary.

REgards,

Stu

This talk of a north-south link has got me wondering about the various aerials for the 351. I have heard it said for the amateur bands the battle whip is as good as, if not better, than the normal patrol whip. Any one care to comment?

Also is the GSA an improvement on the set-top whips and does the Elevation Kit add much?

Down here in the south east we will be watching with interest the planning for the north-south link even if it is unlikely to be heard out our way. If it does, then there is a group of us in West Kent who can field some 352 rebro stations if required.

My experience is limited to the 6m band (51mhz), with the PRC350/351 but based on some various tests I did to verify some radio mobile prediction results for propagation, I found that the sectional arial did give me better range than the battle whip, but it was mainly at the ragged edges of the range. I think mainly what helped was that the arial was basically a bit higher than the battle whip. In general I would add that location and height above ground make a big deal when it comes to the range of these sets. I would expect the GSA to add some range as its a more efficient antenna system compared to the battle whip and 1.2m arial. Also I would expect a big boost range wise by elevating the GSA as much as is practical.

The VHF Antennas Technical Description EMER TELS L212 gives gains (but relative to something unspecified so may well be the battle whip) as follows

Ground Mounted Monopole -4.5dB at 30 MHz -1.5dB at 76MHz

Inverted Vee > 5 dB at 30MHz > 7dB at 76MHz

GSA > 10dB at 30 MHz > 6dB at 55MHz > 9dB at 76Mhz

EKGSA None given

EVHF Pineapple None given

I believe the GSA is the best of the omnidirectional antennas – certainly it is the only one that can be adjusted for near resonance and it can be made a good match to 50 ohms on both 4m and 6m - but I have difficulty believing the GSA gain is that much better than the inverted V.

I expect that the EKGSA will perform slightly better than a GSA partly due to height and partly because the presence of the ¼ wave coax below the feedpoint will tend to lower the radiation angle. I'm told the improvement supposedly due to the ¼ wave coax and choke versus a coax from the GSA base to the radio in elevated installations wasn't obvious in real use, however.

I am fairly sure from my studies of the EVHF pineapple that it will be in the same league of loss as the ground mounted monopole – it starts with a 2dB attenuator and based on my MFJ analyser tests it is spectacularly badly matched to 50 ohms between 49 and 50.5Mhz in particular. So I think I would be more confident in the GSA and hilltop sites, with the inverted V a viable alternative for long hops especially on 4m.

At the weekend, I had occasion to compare the GSA and the elevated GSA on the same path, line of sight, to a set with a whip at ground level lower down a long steep hill. The frequency was 42 MHz (it wasn't an amateur net) and the sets were 250mW 349s. My analyser gave an identical SWR for the GSA and the same GSA elevated on a 5.4m mast; it was 1.5 for the best length of whip (8 short elements in both cases).
The elevated GSA was still sustaining the link at 2.5 kms, while the GSA supported link had dropped out at about 1km.
Not very scientific I'm afraid, over very wet ground, and through very wet trees for each variant.

Dear folk

I admire your intentions of forming a long chain of rebro's, but speaking from experience in a similar excersise, I really don't think this will work.

Can I suggest you first try a localised loop - 3 or for hops, possibly the return path terminating at the originator?

(this means he will get some idea of what the intended recipient will receive).

When I attempted a similar activity using licenced broadcast frequencies, the maximum usable hop links was just three. This was because of the cumalative noise accrued over the propagation path made the SNR unacceptable. It was tried (in vain) with and without DSP, noise reduction systems in all combinations using current high tier comms equipment. Another query is the position regarding licesing?

Apologies if this appears to be pouring cold water over the idea, but I think localised tests, including hilltop to hill top should all be taken into consideration first....

i.e. Set up the chain in stages, then link it through - not a 5 minute job. Co-ordination is another matter....

Best 73 etc...

John.

Subject: RE: [Clansman351] Just thinking

I am up for this. Any rules? All clansman VHF Sets including antenners.

Planning will be interesting (or lack of it:).

What would be the aim? To cover JOhn O'Groats to Lands End (or the furthest point away in Europe?) Using VHF Rebro and Or Relay Messages? (Sets would need to be un-modded in respect of pilot tones of course.)

A database would be needed to plan this together with some path profiling when all the sites are in. Let see....

Starting from the top a 352 Manpack initiates a call into a Rebro on a high spot somewhere in the region John O Groats plus 25 to 100km. The rebro is using two inverted vee antenna which have a range in excess of 100Km each .....This links to a similar Rebro at a similar distance going south etc.

Rather than picking sites at random, picking the best high spots would be my strategy to determine the minimum number of rebros necessary.

REgards,

Stu

John

I did make the point that an end to end rebroadcast was unlikely to work when suggesting possible sites in Scotland - given that I believe a minimum of 5 hops are needed to reach the border I think some form of store and forward (i.e. write down and read back) operation will be needed with rebroadcast to bridge some of the bigger gaps. I think it would still be a useful "field day" type activity to pass a message from John O Groats to the South Coast, but I suspect if the original user had similar needs they would have resorted to HF NVIS, SKYNET satellite, or used a trunked radio system (Ptarmigan) to place a call.

Regards

Iain

Dear folk

I admire your intentions of forming a long chain of rebro's, but speaking from experience in a similar excersise, I really don't think this will work. Can I suggest you first try a localised loop - 3 or for hops, possibly the return path terminating at the originator?
(this means he will get some idea of what the intended recipient will receive).
When I attempted a similar activity using licenced broadcast frequencies, the maximum usable hop links was just three. This was because of the cumalative noise accrued over the propagation path made the SNR unacceptable. It was tried (in vain) with and without DSP, noise reduction systems in all combinations using current high tier comms equipment. Another query is the position regarding licesing?
Apologies if this appears to be pouring cold water over the idea, but I think localised tests, including hilltop to hill top should all be taken into consideration first....
i.e. Set up the chain in stages, then link it through - not a 5 minute job. Co-ordination is another matter....
Best 73 etc...

John.

Stuart

Having started as GM1WCK in the far north I think you have two options - to use multiple hops between high ground or to follow the coast using unobstructed overwater paths where possible.

From my own experience north of Inverness I never had any luck getting to the South of Scotland on VHF - probably because there are several sets of high ground blocking the path between Slochd and Perth on the way south and could only work along the northeast coast round to Aberdeen across the Moray Firth), so I would suggest (also to avoid much mountain climbing) to rely on the unobstructed overwater paths across the Moray Firth from John O Groats to Peterhead and then down the east coast past Fife to somewhere around Dunbar to cover Scotland in as few hops as possible. This is also what the cold war microwave links did.

John O'Groats itself is at sea level with a ridge to the south - it's probably worth going a few miles to the South East to Duncansby Head (63 metres asl; grid ND 405 632) with a clear sea path to the South and South East. That should have a clear overwater hop to one of the small hills west of Peterhead and South of Fraserburgh. Mormond Hill would be ideal (230m asl) but the MoD got there first :(Windyheads Hill a few miles west (highest accessible 214m ASL, grid NJ851623) is accessible by road, with as good a view back to John O'Groats but more blockage South.

Peterhead to somewhere East of Edinburgh is probably too far (about 160-180km) for one hop over water with military antennas - with a yagi and more power possibly quite feasible. I suspect an overland hop to high ground near Stonehaven would be needed (as an aside when I first moved here the works radio club at Martlesham used to work Alan GM4ZUK based on a hill somewhere near there on 2m using 400W each end in flat conditions every contest). Somewhere west of Portlethen should be suitable - the road reaches about 150m near Rothnick NO 872 957 with a good takeoff to the South East. Another candidate would be Cheyne Hill NO 834 874 west of Montrose.

Going inland the first accessible high point would likely be the high ground near Tain. I used to operate /p at Quarryhill car park 200m asl grid NH751 812. That site can see the cairngorms and the highest easily accessible point on the A9 through the mountains is Slochd NH 834 258. An intermediate site near Inverness would be off the A9 at Mealmore Lodge 284m asl NGR NH 748 379 or Daviot NH 722 407. For the best site between Inverness and Perth it would be better to go off road courtesy of the Cairngorm chairlift and railway though ! Ptarmigan Station is at 1100m and NGR NJ 004 049 has a poor takeoff to the South - better to the Southeast. The peak is NJ 006 040. The next hop would need to be high ground north of Dundee and West of Arbroath - you can get to 199m on Dunnechan Hil near Letham at NGR NO 505

495 with good takeoff NW and SSE.

From either of these sites there should be a clear path across the sea east of Fife to somewhere between Dunbar and Eyemouth - Dowlaw Road around NT 834 693 or Telegraph Hill NT 855 702 or between Crosslaw and Lumsdane at NGR NT 876 687- and after that it's over to the Northumbrians !

Hopefully these NGRs can be an input to those with path prediction software.

Having said that it's going to be 4 or 5 hops to the border so I suspect that a pure VHF rebro chain won't be viable, but human message passing certainly will.

Regards

Iain

>
Hi Geoffrey, The only batteries I have used for a rebuild are NiCads, I used 4Ah D cells tubed in pairs, I use 10 sets per battery, I make up the sensor diodes before I start on the battery, two 1N4148 diodes in series for each sensor I use heat shrink sleeving over the diodes, I use 12 inch wires (red and black) any excess I cut off just before I connect them to the charger socket, the last wires I connect are the 2 wires to the cells themselves after fitting the charger socket and ALL its wiring up to the contacts in the lid, only then I connect the cell wiring to the same contacts, take your time and be carefull if you are using Nicads, they are usually sold charged!.

They certainly did some exercises round here - I remember a Triffid (with the tubular dish antenna up) parked at the corner of the B1077/B1078 junction near Ashbocking TM 181 537 sometime in the mid 1990s but we are near Colchester. I suppose that the plan then for the UK mainland was to use wired communications and fall back to NCS data links rather than Ptarmigan if need be.

Hi Iain,

Apologies for the late response but I like your (brilliant) synopsis. The high spots overlooking the East Coast looks like the least number of hops all the way down to Kent from J-O-G.

I noted NVIS is very useful in Scotland where the Rebro, I found. was not - too costly in manpower and logistics for a start.

Anybody plotting?

I agree that if you want it to work well rather than prove it can be done on VHF a couple of NVIS hops would win (I wonder if NCRS had store & forward capability?). I think the problem with multi-hop VHF would really come South of the Humber as there are no more high clifftop sites until you reach Kent so probably better to complete the chain from Northumberland down the Pennines if staying on VHF.

I suppose sticking to 351/352 technology the only way to do store and forward at some sites to overcome the number of hops would be through use of a MEROD/TDED as the store and forward terminal at each hilltop ? Did anyone use the 352 with a teleprinter and paper tape (I'm not volunteering to take an ATR and T100 up a mountain btw!). Or was Mk 1 Pencil and Mk 2 soggy paper the preferred solution for hilltop sites? (as an aside I found a good e-Bay source of ex military waterproof notebooks recently)

The 353 makes for the better RRB and on 50w into two back to back inverted vee' I expect the directional coverage to be 200+ in rolling countryside. I recall working a 349 (200mw) on whip to a 353 on whip between Snowdon and the Cat and Fiddle in Cheshire - 100 plus miles LOS. I dread to think how far you would get if you sited an RRB for maximum effect with directional antenners like the inverted vee.

If I understand it right what you are saying, the path(s) between the areas: J-O-G and Peterhead (F1) and Peterhead, rebroadcast directionally to a high spot in East Anglia (F2) look quite easy. Then after that, striking WSW directionally from there (on F1) again with an intermediate RRB on F2 might well be viable on FM.

While the operating modes available on 351 included data (pre dating Merod) I think it must have been a bit exotic to see one hooked up to an ATR. Also I can't recall but I seem to think you could RRB with a three set installation and come in on one set and go out on two - now that would be handy - with a third channel open you could go off into mainland europe at some point. Then by ip into the internet for the rest of the world :)

Comments from local amateurs or people who have worked these paths would be useful.

Regards,

Stu

Stuart

I agree that if you want it to work well rather than prove it can be done on VHF a couple of NVIS hops would win (I wonder if NCRS had store & forward capability?). I think the problem with multi-hop VHF would really come South of the Humber as there are no more high clifftop sites until you reach Kent so probably better to complete the chain from Northumberland down the Pennines if staying on VHF.

I suppose sticking to 351/352 technology the only way to do store and forward at some sites to overcome the number of hops would be through use of a MEROD/TDED as the store and forward terminal at each hilltop ? Did anyone use the 352 with a teleprinter and paper tape (I’m not volunteering to take an ATR and T100 up a mountain btw!). Or was Mk 1 Pencil and Mk 2 soggy paper the preferred solution for hilltop sites? (as an aside I found a good e-Bay source of ex military waterproof notebooks recently)

Hi Iain,

Apologies for the late response but I like your (brilliant) synopsis. The high spots overlooking the East Coast looks like the least number of hops all the way down to Kent from J-O-G.

I noted NVIS is very useful in Scotland where the Rebro, I found. was not - too costly in manpower and logistics for a start.

Anybody plotting?

Subject: RE: [Clansman351] Just thinking

Stuart

Having started as GM1WCK in the far north I think you have two options – to use multiple hops between high ground or to follow the coast using unobstructed overwater paths where possible.

From my own experience north of Inverness I never had any luck getting to the South of Scotland on VHF – probably because there are several sets of high ground blocking the path between Slochd and Perth on the way south and could only work along the northeast coast round to Aberdeen across the Moray Firth), so I would suggest (also to avoid much mountain climbing) to rely on the unobstructed overwater paths across the Moray Firth from John O Groats to Peterhead and then down the east coast past Fife to somewhere around Dunbar to cover Scotland in as few hops as possible. This is also what the cold war microwave links did.

John O’Groats itself is at sea level with a ridge to the south – it’s probably worth going a few miles to the South East to Duncansby Head (63 metres asl; grid ND 405 632) with a clear sea path to the South and South East. That should have a clear overwater hop to one of the small hills west of Peterhead and South of Fraserburgh. Mormond Hill would be ideal (230m asl) but the MoD got there first L Windyheads Hill a few miles west (highest accessible 214m ASL, grid NJ851623) is accessible by road, with as good a view back to John O’Groats but more blockage South.

Peterhead to somewhere East of Edinburgh is probably too far (about 160-180km) for one hop over water with military antennas – with a yagi and more power possibly quite feasible. I suspect an overland hop to high ground near Stonehaven would be needed (as an aside when I first moved here the works radio club at Martlesham used to work Alan GM4ZUK based on a hill somewhere near there on 2m using 400W each end in flat conditions every contest). Somewhere west of Portlethen should be suitable – the road reaches about 150m near Rothnick NO 872 957 with a good takeoff to the South East. Another candidate would be Cheyne Hill NO 834 874 west of Montrose.

Going inland the first accessible high point would likely be the high ground near Tain. I used to operate /p at Quarryhill car park 200m asl grid NH751 812. That site can see the cairngorms and the highest easily accessible point on the A9 through the mountains is Slochd NH 834 258. An intermediate site near Inverness would be off the A9 at Mealmore Lodge 284m asl NGR NH 748 379 or Daviot NH 722 407. For the best site between Inverness and Perth it would be better to go off road courtesy of the Cairngorm chairlift and railway though ! Ptarmigan Station is at 1100m and NGR NJ 004 049 has a poor takeoff to the South – better to the Southeast. The peak is NJ 006 040. The next hop would need to be high ground north of Dundee and West of Arbroath – you can get to 199m on Dunnechan Hil near Letham at NGR NO 505 495 with good takeoff NW and SSE.

From either of these sites there should be a clear path across the sea east of Fife to somewhere between Dunbar and Eyemouth - Dowlaw Road around NT 834 693 or Telegraph Hill NT 855 702 or between Crosslaw and Lumsdane at NGR NT 876 687– and after that it’s over to the Northumbrians !

Hopefully these NGRs can be an input to those with path prediction software.

Having said that it’s going to be 4 or 5 hops to the border so I suspect that a pure VHF rebro chain won’t be viable, but human message passing certainly will.

I am up for this. Any rules? All clansman VHF Sets including antenners.

Planning will be interesting (or lack of it:).

What would be the aim? To cover JOhn O'Groats to Lands End (or the furthest point away in Europe?) Using VHF Rebro and Or Relay Messages? (Sets would need to be un-modded in respect of pilot tones of course.)

A database would be needed to plan this together with some path profiling when all the sites are in. Let see....

Starting from the top a 352 Manpack initiates a call into a Rebro on a high spot somewhere in the region John O Groats plus 25 to 100km. The rebro is using two inverted vee antenna which have a range in excess of 100Km each .....This links to a similar Rebro at a similar distance going south etc.

Rather than picking sites at random, picking the best high spots would be my strategy to determine the minimum number of rebros necessary.

The unwanted attachments seem to be part of the Yahoo branding in the message I replied to – hopefully by deleting all under my signature I have got rid of them. The notebooks were made by “Rite in the Rain” (www.ritr.co.uk <http://www.ritr.co.uk>) and sold as MoD surplus – not sure if they actually are but they do seem to work – total immersion doesn’t soften the pages and both pencil and biro survive several seconds under the tap.

For multi hop VHF with Rebro or write down and repeat forwarding I had thought of 4 hops to reach the border – John O'Groats to Peterhead, Peterhead to Montrose, Montrose to Dunbar and then Dunbar to somewhere in Northumberland. That would work out between 100km and 200km per hop which should be reliable at 352/353 power levels line of sight or between elevated sites over water. All of the sites have road access so a FFR Landrover with 353s could be used. All paths are between 100+ metres hills over water except Peterhead to Montrose which is probably the most difficult hop.

The 1990s QSOs between GM4ZUK and G4MRS/P I mentioned from somewhere north of Dundee to Otley on high ground North of Ipswich were on 2m SSB with stacked long yagis (getting on 20dB gain) and 400 contest watts each end so probably beyond 353/inverted V reach with 50W and 6-8dB gain even allowing for better propagation on 4 or 6m. It would be interesting to know how far down the East Coast one can get from somewhere around Aberdeen though to see if Peterhead to Northumberland would work, for example.

There was a 4-way rebroadcast box (IBRU) which also supported the DMU/BID-250 secure voice system. See: http://www.g0ozs.org/clansman/misc/IBRU001.html but I dont think it solves the accumulation of noise and distortion inherent in multiple hops.

That should have a clear overwater hop to one of the small hills west of Peterhead and South of Fraserburgh. Mormond Hill would be ideal (230m asl) but the MoD got there first L Windyheads Hill a few miles west (highest accessible 214m ASL, grid NJ851623) is accessible by road, with as good a view back to John O'Groats but more blockage South.

Peterhead to somewhere East of Edinburgh is probably too far (about 160-180km) for one hop over water with military antennas – with a yagi and more power possibly quite feasible. I suspect an overland hop to high ground near Stonehaven would be needed (as an aside when I first moved here the works radio club at Martlesham used to work Alan GM4ZUK based on a hill somewhere near there on 2m using 400W each end in flat conditions every contest). Somewhere west of Portlethen should be suitable – the road reaches about 150m near Rothnick NO 872 957 with a good takeoff to the South East. Another candidate would be Cheyne Hill NO 834 874 west of Montrose.

Going inland the first accessible high point would likely be the high ground near Tain. I used to operate /p at Quarryhill car park 200m asl grid NH751 812. That site can see the cairngorms and the highest easily accessible point on the A9 through the mountains is Slochd NH 834 258. An intermediate site near Inverness would be off the A9 at Mealmore Lodge 284m asl NGR NH 748 379 or Daviot NH 722 407. For the best site between Inverness and

Perth it would be better to go off road courtesy of the Cairngorm chairlift and railway though ! Ptarmigan Station is at 1100m and NGR NJ 004 049 has a poor takeoff to the South – better to the Southeast. The peak is NJ 006 040. The next hop would need to be high ground north of Dundee and West of Arbroath – you can get to 199m on Dunnechan Hil near Letham at NGR NO 505 495 with good takeoff NW and SSE.

From either of these sites there should be a clear path across the sea east of Fife to somewhere between Dunbar and Eyemouth - Dowlaw Road around NT 834 693 or Telegraph Hill NT 855 702 or between Crosslaw and Lumsdane at NGR NT 876 687– and after that it’s over to the Northumbrians !

Hopefully these NGRs can be an input to those with path prediction software.

Having said that it’s going to be 4 or 5 hops to the border so I suspect that a pure VHF rebro chain won’t be viable, but human message passing certainly will.

Regards

Iain

Subject: RE: [Clansman351] Just thinking

I am up for this. Any rules? All clansman VHF Sets including antenners.

Planning will be interesting (or lack of it:).

What would be the aim? To cover JOhn O'Groats to Lands End (or the furthest point away in Europe?) Using VHF Rebro and Or Relay Messages? (Sets would need to be un-modded in respect of pilot tones of course.)

A database would be needed to plan this together with some path profiling when all the sites are in. Let see....

Starting from the top a 352 Manpack initiates a call into a Rebro on a high spot somewhere in the region John O Groats plus 25 to 100km. The rebro is using two inverted vee antenna which have a range in excess of 100Km each .....This links to a similar Rebro at a similar distance going south etc.

Rather than picking sites at random, picking the best high spots would be my strategy to determine the minimum number of rebros necessary.

REgards,

Stu

Hi all many thanks for all your help and advice you give with respect to re thinking, All I was wanting to do is to plan a w/end to use the clansman radios even if you just have 2 contacts to me that would be great. Years ago some one said the valves are going out all over the world and we may never see them re lit in out time, Will this happen with out green radios.

Hi

I wouldn't consider Clansman radios as end of life devices yet. I am using 320 quite regurarily as portable and 351 on few occassions too. Ok, I have it doubled and spare sets are lying in a secure place "just in case". Someone said that one green radio isn't enough and now I know it myself!

So far fixing and refurbishing them isn't so difficult (of course if no specialised component go off). Ah, and no valves here. What was last valved set before - a Larksur line? And still there's tonns of military valves around for next to nothing. Maybe its a good time for getting some spares now?

Kind regards de EI7GMB Arthur

One thing to consider with the military is I am running equipment from the 50 ' s and there are plentiful parts around. Some of the real popular stuff like the R-390 has a little cottage industry of guys who have come up with parts/circuits for things that are unobtainium!

Also if the military determines that 5000 widgets will get the job done they will quadruple it and stock 20000 widgets.

Robert, Arthur

I think the early integrated circuit era - which covers the design if not the build of the 351/2 and 320 - is actually more challenging for long term spares supplies than the 1950s when valves/tubes were in production for two or three decades (so there are substantial stocks remaining) and mostly well documented with equivalents. Some of the devices in the 351/2 and 320 were only made for a few years in the 1970s just for Clansman and no device documentation has reached the public domain, so spares are only available in NOS or salvage Clansman modules. I suspect someone is going to have to start making plug compatible modules with modern parts once the spare module stock runs out. This is a specific issue for modules that appear to have a finite life such as the PRC320 PSU that tends to suffer capacitor failure.

To some extent that happened already in service due to unavailability of PA devices for both HF radios (320 and 321) with a new PA board being fitted as replacement in later years (the 320 one has FETs instead of Bipolars and the 321 one has SGS rather than TRW devices).

Regards

Hi Troops.
the last valve set was surprisingly enough a member of the Clansman family,the uk/vrc353
which hads a valve p.a. stage and a valve r.f amp in the reciever.There is also the add-on p.a. for the uk/vrc321,the '322 with that whopping big valve in it which seems to contain unobtanium unless large ammounts of cash are applied to neutralise this ! despite that Clansman lives !!

Hi Arthur, I was wondering that as well, having obtained a spare TX and RX module for the 353 I shall (when I have time) open up the transmitter module and have a peek, as far as the EMER says it is a power Tetrode, and I have heard they are soldered in.

Artur, Leighton

They are GEC (aka M-O Valve) conduction cooled specials with welded electrodes. I think the RT322 one is the YL1550 tetrode (300W at up to 500MHz). I do have an M-O Valve data sheet for that one.

I think the part numbers for the ones in the 353 were posted once in the Clansman_Larkspur group but I can't instantly find it. G8UMX or G4JAC may know.

The vrc353 is to my mind an abomination.The valves in the p.a. stage and the rx rf amp are not mounted in sockets.They are conduction cooled with an extrnal anode and are connected to the circuit-boards by silver tape spot-welded to silver tape strips and via these strips to the tuning turrets.An absolute pig to get out and very hard to test without the special jig.I believe they are specially selected 4cx150.The valve in the vrc322 is a co-axial tetrode air-cooled and I think that it was a special for that job.I have only ever seen them mounted in the p.a.- cost if you can find one is in excess of £2k so if you buy the p.a. buy two as it will be cheaper to replace the whole thing than try to source a spare valve if it goes soft or looses emmission.No knwn equivalen sorry to say

Hi Geoffrey, Personally I would suggest a normal 13.8v bench psu, you will need about 4 amps, using it from a car battery may be problematic, as the input volts drop the charger will take more power to maintain the charge and will get even hotter, which you do not want to happen!.

Roughly speaking that is what it is designed for, but be careful it
flattens one fairly quickly

(from experience of leaving it on while I was away!

Hi All
I have seen two versions of the DCCU . The earlier chargers take more current and get hotter. The later ones have LED lights and also the green light will flash if the cable is not connected to the battery or there is a fault.
I picked up one of the later ones f12 volts for £20 a couple of weeks ago. The later ones are worth having

cOLLECTIVE EXPERIENCE FROM FORMER rOYAL sIGNALS OPERATORS, SAYS:

(Read in reverse order, perhaps!)

Yes very true.

But AMF RADIO TROOP only ever had C11/R210 and C42s.

AMF later became AMF(L) Force RADIO TROOP with exercises in Arctic Norway X5 Turkey X2 and Greece x1.

I took part in all of the exercises in a Special Land Rover with C11/R210 and C42s. Our main roll was VHF REBROADCAST

Soldier Mag had an article on AMF(L) on exercise in BARDFOSS involving me Skiing and snow shoeing from one REBRO site to another to borrow a spare C42.

As one of mine had packed up.

Not easy when temp -37 deg C but that one packed up as well> had to wait for RAF to fly another in. That REBRO was on top of a mountain. All the equipment was flow in including me and the op, By the RAF. But flown out by Royal Navy as it was snowing too hard for the RAF.

The on ground REBROARDCAST Stations in Norway where mounted in the back of Volvo Snow Cats.

All other exercise areas in the back of Land Rovers.

Hi interesting back in UKLF days when 2 Brigade 38sigsV has c42 repeaters we very often remoted thr Sheffield HQ Tass teleprinter circuit around the UK devon to Sheffield or Sheffield to Scotland Ian McGowan G8OFZ may have better recollections of this as we had to get a special BT interface to simulate the cleardown correctly .

It often bafflef BT service engineers because their records showe Tass terminal was in sheffield but we were asking them to turn up in some field the other end of the counyty on exercise.

So yes it may be posdible if the interposing sited have a good lift off

GM ALL,

In 1969 I finished my tour with 644 Sig Troop. And was posted to Blandford to join a Brand new Troop.

AMF Radio troop. For the first few months we had nothing, no Vehicles or Radios. But thanks to Capt Ray Webb (QM)

We got sorted, also more members joined the Troop.

In early 1970 it was decided we would provide the communications for the 9th British Commonwealth Games to be held

At the Meadowbank Stadium in EDINBURGH . The equipment we had Special Land Rovers 2x C42 and High power C11/R234.

To make the journey to Edinburgh more interesting we set up a REBRO chain from Blandford Camp to Meadowbank Stadium.

I can not remember how many Rebro Stations we set up.But all used 27 foot masts and 8 foot Whips.

I was the last REBRO and had to drive as High as I could get up ARTHERS SEAT on the outskirts of EDINBURGH .

The final Station was a C42 in the commentary box at the Stadium.The LINK WORKED and a message was passed back to Blandford

By our OC to say AMF had CONCURED SCOTLAND .

All the rest of the Troop joined us and spent a very HAPPY time. 3 weeks getting ready and then providing the Comms for all events.

There must be a record of this somewhere but I can mot find it.

Hope this HELPS

Geoff

Beware that the DCCU switch leads easily short to a power transistor inside if the switch is rotated – at least one group member has documented the resulting repair. So best not powered until the switch is secured and the pins insulated !

Regards

Iain

Geoff

I’d probably replace it – just make sure the tags and solder behind the switch are well covered with tape or better heatshrink tube!

Regards

Iain

Well that was interesting:

The ATU is out and I can post that off this week so all well and good there.

I got the set stripped out and removed the face panel and I found it has a LSB filter where I think the USB filter should go. That could be handy

One of the repairs I need to do requires a power supply module - which was absent maybe I was a bit naive to think I would get a working PSU module from this. Will source this separately.

The other (I think) needs a power switch. The only functions that work are off, HP and battery check.

I have learnt how to get to the switches at the rear of the face panel, without stripping out unnecessary parts, so I am hoping to find when I get there, some broken connections - I found the schematics, but I am wondering if its not the switch what else could the problem be?

Managed a couple of Clansman Skeds even, so how's that?

Does anybody have a parts list for the PRC344 ?. I am still trying to identify several of these modules and PECs I bought, I have identified some for the 320, 349 and 1 module for the 344 (marked for the 344) the part numbers look as if they are in the same series for the 344 But I do not have any manuals (yet) . If any body has please mail me off list and I will send you the part numbers I have yet to ID. Leighton. GW3FSP.

From: <mike@...>
Topic: 1056 Message: 1069

Touched up the paintwork on my PRC-350 - it did the job, cheap and cheerful..:

"I thoroughly cleaned the radio body so that the paint had a good surface to adhere to. Opened a tin of Humbrol No: 75 Bronze Green matt enamel paint and stirred thoroughly. Applied paint to the areas that required touching up with a soft brush. Left the radio to thoroughly dry for a couple of days, then sprayed the surface lightly with WD40. Allowed it to sit for a few minutes, then rubbed the excess off with a soft cloth. Kept rubbing around the radio until the WD40 had dried off and the paint had a uniform appearance all over, this give the finish the semi-matt appearance and colour which blends in well with the original paint."

John

I agree with you – the lack of a carrier frame means it has to be a 350 (which had straps directly connected to the radio body)

Thanks for that Geoff, I have found that the Tipp Ex dirties quickly
through use, so a Matt Clear Nail Varnish solves that problem..
You have to apply the varnish quickly and in one go otherwise it melts
the Tipp EX :-(

Mike

Hi there I am located in Filey so I should be able to hear you from Sutton Bank. It is on my target too for operation this summer. I have a Clansman mast and can elevate the GSA . Let me know when you are up their and I will fire up a 352 + mast from home and see if we can work.It is line of sight. When up there, you are right next door to the GB3HG 2 metre repeater which I can work from here so that could be a good "back channel" while setting up the Clansman gear
Cheers

Topic: 1079 Message: 1084

Hi there Of course you can ask a question :-)
The amp you can see on the picture on the first page of this group.
You use a BNC totake the output from the output of 351 and then connect to the input of the amp . It sounds obvious but make sure no whips are connected to the 351. The out put of the amp then goes to an antenna which for amateur use means a 4 or 6 metre antenna.
You cannot use the whips with the amp.
The simplest Clansman antenna is the GSA (ground spike antenna) and this does what it says on the tin. You mount on a spike and stick it in the ground :-). The number of rods inserted into the anteen to make the vertiical whip is defined by which band you are on.
The early versions had (if my memory serves me correctly) 4 sections and the later ones 5 sections. You get a better match with the 5 section one. The antenna base tells you how many rods to insert for the intended frequency of operation.
The amp has a band switch which you select for the appropriate band too.
These amps are not hugh power out. Typically anything above 14 watts is good.
A further refinement on the GSA is to get a 5.4 metre Clansman mast and the elevation kit which mounts the GSA on the top of the mast and this has appropriate balun type unit to match the antenna . In the Clansman world this is known as the EK-GSA.
Of course there are other Clansman antennae that can be used. There is one that looks like a fold out clothes dryer . I have never used one of these and there is I believe an inverted V type of antenna which by all accounts is very efficient.
I hope this helps and I am sure other folks will chip in and fill in the blanks in my memory. The last time I used any of my gear was last summer and so I cannot remember it all. Roll on the summer :-)
Cheers

You can use whips with the amp if you put a SURF on the amp output, and tune it with the amp switched off. I am reliably informed that the SURF can cope with the 20 watts from the amp provided it has been tuned first.

Might be best to use the patrol whip in case whatever is in the bottom of the battle whip cannot cope with the higher power.

Hi Troops,
the best (only) place for the surf is between the set and the p.a...Apart from the question of the surf components ratings there another.The tuning point of the surf changes significantly when the the p.a. becomes active.After the relays inside there is an attenuator so a fairly constant impedance is seen by the filter.If the filter is after the p.a the the tuning point will shift as the output impedence is now dependant on that of the antenna and the filter is now detuned.Inbypass mode the surf sees the output of the band-pass filter which may not be 50ohms and the filter is detuned when the p.a. - not the tidiest explanation but I think the point is made.The other point is operator linked - with a detuned antenna the vswr will have changed and the voltage at the antenna may well rise 20W+ that close to my earholes-NOT

1089. Surf rebroadcast selectivity

Yahoo group: Clansman351
Date: 2014-04-03 16:31:25 UTC
From: <harlikwin667@...>
Topic: 1089 Message: 1089

What is a practical minimum frequency difference that can be used with a rebroadcast setup using a pair of 351's/352's both with a SURF? Would 3-4 mhz (i.e. within the 6m) be sufficient? I'm in the US so I don't have the luxury of both the 6m and 4m bands you UK guys have.

Roman -KD0PUJ

1090. Re: Surf rebroadcast selectivity

Yahoo group: Clansman351
Date: 2014-04-04 07:09:23 UTC
From: Stewart Gebbie
Topic: 1089 Message: 1090

HI there

The original Racal Handbook for the PRC 351 and PRC 352 has the following specification for using two stations which are co-located.I have typed out what is in the manual.

" It is desirable to use the SURF 4 WATT at both stations. If the frequency separation is 10% the table below gives the minimum disiances the stations can be apart for optimum performance.

Type of Station Minimum Separation

Uk/PRC351 15 metres

UK/PRC352 50 metres

UK/PRC351 with SURF 4W 2 metres

UK/PRC/352 with SURF 4W 5 metres

With much greater distances apart it is possible to reduce the frequency separation so that at distances of 1Km it is normally possible to operate with frequency separation of 25Khz and 50Khz.

So the conclusion is that it in the USA 6 metres band the separation would need to be 50 MHz to use the 351 at 2 metres separation. I have never tried it but getting just under 4Mhz separation on the USA 6 metre band and a pair of PRC351's at a distance of 5 metres should give results which if not perfect could be acceptable. It is worth testing this .

I hope this helps

Cheers

From: <harlikwin667@...>
Topic: 1089 Message: 1092

Hi Stuart,

Well in theory it looks doable. I'll have to get a pair of SURFs ordered and try it out. Separating the stations shouldn't be a big problem for my purposes, rather the major constraint is the US 6m band plan. I've also toyed with the idea of doing the 10m mod on them for this reason, but I would have to figure out other gear to work on both 6m and 10m then as well.

1093. Using a PRC-351 on 6 meters in US

Hello,
I'm not sure if has been discussed before but I have two PRC-351 radio kits I bought a few years ago. Since I've owned them I have yet to make a contact on 6-meters or pick up a clear transmission. I can tune to a freq and hear static noise from others transmitting but no voice. When I've transmitted I think some one may picking me up but have no way to confirm since all I get back is static. I can tune in baby monitors on 149.9Mhz and hear clear sounds from the room where it's located. I understand that the 351 can communicate with the PRC-25/77 which I've used in the Army but don't have access to any longer.

Any tips on what I can do or check with the 351's I have so I can get some use out of them?

Thanks,
Jim

Hi Jim,

Where in the US are you located? Many of us have PRC-351's, and they work quite well with most other FM 6m ham and military radios. If the radios are working properly, you really shouldn't have any problems. The 351 has excellent specs, and are compatible with both carrier squelch ham and commercial radios, as well as 150Hz squelch US Military PRC-25/77 style wide band radios. They don't work as well with the US Military radios, but they will work.

What frequencies are you trying, and what is your callsign? Feel free to send me a direct email if you wish. We have a local 6m military radio net in my neck of the woods, maybe you could join us?

Garret

Hello Garret et All,
??
? ? ? ? ?What frequency is this net on and what is the schedule for it? I might give it a try from Bradford Ontario Canada! Who knows?? It is the "magic" band! LOL?
? ? ? Anyway, all kidding aside, I would definitely try with a good antenna and some power and see what goes. Some others may be interested in giving it a shot. Is there a web site for this club/net?

Hi there Inside a 351 when you open it up its like opening a book. There are flexible printed circuit connector "cables" . Open the radio really carefully. With age these can become brittle and go open circuit.
This is the first place I would look but be really really careful and gentle as you dont want to accidentally make the problem worse!
Cheers

Hi Peter, the switch positions - O - amplifier off, - T - Radio Test ,(you need the operators user handbook for the full system test procedures,) then you have the 3 frequency band settings. When using the amplifier you must have the correct number of aerial elements fitted to the GSA for the band you will be using.
You do not need the SURF connected when using the amplifier, DO NOT connect the surf between the amplifier and aerial, it is only used wired directly to the 351 THEN (if needed) to the amplifier.
Leighton. GW3FSP.

Many thanks Leighton. I do not have a surf unit, been using the radio with amp into a 1/4 wave whip on 4m. But only had two partial contacts in two days, but then again only from low height at home qth.
Fractions frequency knob has just fell in two, so another issue to solve.

Peter.

Hi Jim,
The PRC-351's are nice radios for 6 meters when you get the bugs worked out. I've checked out about 10 of them including my own and a batch we bought for a Military Vehicle group.

It sounds like your receivers are working and one or both transmitters are not transmitting audio but do transmit carrier, right? My suggestion is to verify your audio accessories are all in top condition. I have seen several handsets and headsets with intermittents that do not allow full transmit switching in the headset, or no audio out of the mike. The connectors on the radio have also been problematic. If one does not seem to work, switch to the other connector.

One of mine had the sockets full of sand and when the headset was plugged in there was no contact. I blew out the 7 sockets with air and sprayed with Deoxit. I'd suggest pulling the covers on your handsets and checking all those push-on connectors. A touch of Deoxit directed toward the switches can't hurt either. Then operate the PTT a few hundred times!

You should be able to use your two sets to talk to each other. Just be sure the receiver audio is to a headset so feedback is minimized, and use a dummy RF load on the TX..

I have opened up several of the '351's but have yet to find anything wrong internally. I have been told that flexing the decades-old flexible circuits when the rear cover is off is risky. If those flex circuits go bad, there's no repair.

Bob WB4ETT

1105. What frequencies are recommended?

Hi Jim,
Sorry for the delay in my response. Before you open them up, I'd make sure of what exactly is not working, i.e. do they receive ok, but just not transmit etc. In my short experience with these radios, the accessories and their connectors are about 90% of most problems.

Did you get a chance to test them this weekend? If so, do the radios talk to each other ok? Do you have another radio to compare with? It sounds like if you are able to receive baby monitors, that the receivers, power supply, synthesizer, squelch and other basic components must be working ok. So maybe the problem is transmit microphone audio? Do you have a wattmeter to see if they are transmitting a carrier at all? Do you have a ham radio or scanner you could program to listen for transmit audio?

Regarding out local 6m net, it is a sporadic event, kind of on-demand sort of thing on 51.000MHz. We have a local Military Vehicle Club, the Knoxville Military Vehicle Collectors (KMVC) and most of us have PRC-352's (PRC-351 with the 20W amp) in our Military vehicles. We are located in East Tennessee, in the Knoxville area. I'd say that we would have to have some of that magic propagation to reach you in North Virginia. But you never know, this is the time of the sunspot cycle for such things!

Let us know how your testing goes. One final thought: I would not recommend opening up the radio until you have eliminated the accessories and connectors as the problem. These radios are not particularly service friendly. They are not like PRC-77's with the plug-in modules. The 351 is pretty tight inside, with several flex circuits which can get brittle with age, and also the modules are soldered in place. They are however very well made, high quality radios, with very good RF specs. The performance tends to be significantly better than the PRC-77 generation of radios.

Hello Jim,
? ? Garret is correct in his suggestions. In my situation, I had 3 different headsets and a few different hand sets with my 351. It was cleaning of the connectors, cleaning of the hand set switch contacts, and a re-solder of a wire on a headset connector that finally got my 351 working. I would try and eliminate all of these ancillary issues before opening up the 351. I was able to send transmission to my scanner with full audio, and receive from my 6m Alinco FM transceiver. I find that these small issues are the same with quite a few of the mil-spec radios.?
? ? ? ? ? I also had a similar issue with the H4855, PRR, or PRC-343. This is a small 2.4Ghz transceiver and to get it working I had to re-solder a wire from the headset connector, and also, after opening up the PTT module, had to reset a PC board connector, which I then glued down.?
? ? ? ? ?Hopefully you get it all sorted with little effort.

Hello Robin,

The most likely use is the odd local QSO with other radio club members and it seemed sensible to check for a preferred starting point, rather than inadvertently upset anyone else's listening. Our club runs a demo at a couple of local events every year and roaming around the site with odd bits of unusual kit could just attract some attention for us. It would be nothing like the attention stirred up by a QSO from North Oxfordshire to Surrey with a battle whip and a couple of watts of course - but who needs all that fame and fortune... ;o)

Thanks both Garret and Dennis,
I'll have to do an inspection of the handsets for my PRC-351, 320 plus I have a headset with pressel. I've also found some of the wiring cover cracking and exposing the wires so repairs may be needed. I'll keep you posted on the results. I did try checking into 10 meter yesterday but the conditions seemed bad since I could hear only about 2 faint contacts using my Kenwood TS-50. Maybe I'll be ready this weekend.

Thanks,

Jim

And here … but if you monitor, the traffic is about 4 or five calls per day and there are a bunch of regulars…I just leave my 352 permanently on. One useful technique is to leave a VOX recorder connected and the radio on. This will compress all the days traffic into a short recording which you can analyse and plot which stations are operating around you. Not forgetting to put out the odd call yourself like ;-)

G4IYK from Gravesend.

Indeed! Perhaps more activity on 70.450 though. Often at going home time. Certainly is down here.!

I am based just north of Norwich. I have a 351 tuned to 70.450. Also on my desk there is a 350 tuned to 51.700. I have never heard anyone. There does seem to be some electrical interference that intermittently breaks the squelch (muting) circuits though. Interference from my desktop or monitor perhaps?

Hi John

I too have a TRA 967 and I could hear distortion on other radios, sounded like over -deviation so I changed the red-with white stripe mic element for a standard NIB Clansman one, Voila. Worked a treat! ,lovely little radio. Have you seen there are batt boxes and antennas on ebay for it?

I acquired a spare battery box a few weeks ago, Robin, and I already had some aerials. Thanks for the microphone tip - I must check mine sometime and see how it sounds. It has been used a number of times with no adverse comments but that doesn't mean it is OK of course. Perhaps I've only spoken to people too polite to complain... ;o)

Hi Nigel

I have just joined the 4m fraternity using a 353(up to 50w) and Sirio vertical. Located just to the south of Sudbury. Have worked a station north of Stowmarket and one in Ipswich. Who know, given the right conditions, you might hear me in Norwich! Let me know if you do.

Anyone else within range of Sudbury would be welcome of course! I am listening at the moment 16.30z 15th.

Derek, M0JMV

Morning All

I will be up at Hindhead, Surrey

https://maps.google.co.uk/maps?hl=en&tab=wl&q=Hindhead (980□ ASL)

in the Landy, Bristling with antennas this morning at 1100hrs Local (1000HrsZ). I will be listening on 51.70Mhz and 70.450Mhz and 5.371Mhz!

Any suggestions for 40 Metres as well?

Well, had a good day really, first 4 meter reply was from Doug 2E1IGI in Huntingdon, 82 miles! Also heard someone on 6 meters 51.7 but couldn□t tell who! Than plenty of 60 meter and 40 meter stuff.

I will be out again soon

1141. Green radio in mid Suffolk

Yahoo group: Clansman351
Date: 2014-04-24 17:58:34 UTC
From: <ajctrees@...>
Topic: 1141 Message: 1141

I've been into my clansman radios for over a year now, it was the motivation to take first my M6, and now my 2E0. The real gain was passing the intermediate, it means I can add a little oomph to the 351/2, and get my signals out there. And it works very well, I'm in a good spot with a good take off. I now have 17 regular 4m contacts in this area, and I'd like this list to grow. I monitor AND Call on 70.450 whenever I'm in the shack, and I open the squelch to listen for replies. It seems many stations don't call, don't listen, and don't open their squelch to see who is about, it takes activity to make radio happen, otherwise it's a worthless green doorstop. If you're able, get your antennas up there in the clear air, high as possible, if you hold 2e0 or above, use the amplifier to establish contact. The battle whips are next to useless, and IMO using an all in one antenna as supplied is ok for shows, but make or buy a purpose built mono band antenna, and see the results. By all means use the 5.4m mast, and stick something like an end fed upon it. I've done this for 4 and now 6m, one call on 6m and I had a reply straight back.
I know this is teaching many how to suck eggs, it's not meant to be taken the wrong way, but I do find it frustrating when I tak to a station who gives me a 4/3 20km away, then he says he has a 1/4wave on a tin lid in his loft. Better than nowt, I guess, but if you want it to work, you have to work it.
Anyway, enough for now, I'm on most evenings, on 70.450, from about 19.30 till around 2100hrs, if I'm not there, scan the band because I may be chatting a couple of channels down. My locator is JO02mg, so tat should give you an idea of how close you are.

Andy

Happy to give it a go some evening – I don’t have permanent antennas at this QTH so will have to put out a GSA – planning to make a pair of slim jims for 4 & 6 m later this year. QTH is JO02KE (Rattlesden IP30 0SJ on the high ground near the airfield) so I get out fairly well on VHF except to the South. Normally I use a 353 on VHF but I can use a 352 in the garden given good weather !

What evenings are you in next week ?

Regards

Iain

That'd be great Iain. I'm on most evenings as I said, worked he 351/2 on 51.700 into Woolpit on 4w yesterday. I know your approx location, I was scouting for viable high points the other day and remembered the airfield from my youth, good height for Suffolk. I want to encourage more to get on and use the 4/6m bands locally, and in particular green radios (operating the 320 is a breeze in comparison, due to the popularity of HF) I'm in the open nr. Mendlesham airfield, again a brilliant take off for radio comms.

Hello,

I am in that area, and I am quite close to Ian by the looks of it. I am at JO02JE. I have a 351/2.

I don't have a 4M antenna, but I do have a tri-band antenna which will cover 6M. What time/frequency are you around? Do you use the 51.7MHz frequency?

Jack,

M0HER

Hello Jack, I will happily arrange a 6m sked with you so you can use the 351/2, I would need a little notice in order to pop up the 6m antenna, (5min job) or maybe you can listen in and report back here on 4m, or better still make a 4m dipole and join us!!! I am on 70.450 most evenings between 19.30 and 2100hrs, or on nearby channels if we're chatting. If anyone else is in the area, and hears us, or just wants a chat to try out the Green machines, please call in. And keep calling regularly, most of my contacts have resulted from coming back to the calling channel and shouting again.
Andy 2e0DIQ

1151. 351/2 4m activity today (Sunday) NW England

Yahoo group: Clansman351
Date: 2014-04-27 10:36:05 UTC
From: <peter@...>
Topic: 1151 Message: 1151

I am setting off from Manchester to Chester today at about 12pm BST Listening on 70.45 initially with the 351.
1/4 wave on car roof. Any calls on 4m welcome. Should be active for about an hour, then again for another hour on the return leg around 3pm.

Peter G4WLI

Jack

Can use 51.7 with a couple of elements added to the GSA - limited to 15W with that antenna as 50W from the 353 would be beyond its rating

As an aside I notice that the Bury club field day site is described as "near Rattlesden" on their website - I will have to drive/walk round sometime when you are there ! I will try for 70.450MHz first around 7.30pm tomorrow and then tune down to 51.7 around 8, if you are around to try it then ?

Regards

Iain

Hello,

I am in that area, and I am quite close to Ian by the looks of it. I am at JO02JE. I have a 351/2.

I don't have a 4M antenna, but I do have a tri-band antenna which will cover 6M. What time/frequency are you around? Do you use the 51.7MHz frequency?

Jack,

M0HER

I can listen around 70MHz this evening, but it would be nice if I could join in on 6M!

I have emailed a couple of my friends as they may have spare 4M antennas I can borrow or buy. (Unless anyone has a spare GSA and mast!) I actually forgot that I have an EVHF Pineapple, but I lack a mast or support to hold it, and the C to BNC adapter.

As for the field day, that was in 2011! If you scroll through the photos, I am there (M6ATN!) We set up right next to the gliding club's airfield. It was part of a VHF SSB contest and we made several contacts with European stations.

Iain, I'm surprised I haven't seen you at the Bury club seeing as you live so close!

Jack.

Hi

I assume from the antennas in the web site photos at site http://www.radioclubs.net/bsears/articles.php?articles_id=648 the field day is the VHF one 1st weekend of July – if it’s at Rattlesden airfield it will be on the high ground between Rattlesden and Brettenham

Jack

I'll QSY to 6m after trying 4m tonight – I won't have too long as it will be getting close to my daughter's bed time.

I may be able to sort something for a C to BNC adapter for you – EVHF is too heavy to use safely with a 5.4m mast but a length of 25mm id steel tube or an offcut of the 5.4mm mast tube can be used to adapt it to some other mast or as a gable-end mounting (which is what I did at a previous QTH)

I moved to Rattlesden from Manningtree in October and have limited child care options for the evenings so haven't made it to a Bury club meeting yet – I have presented talks at the Culford club venue in the distant past.

Regards

Iain

Ok, I've set up the 4 and 6m antennas, with an inline switch to alternate across to 6 at 8pm. Fingers crossed everything will be ok!!! If this works I think it would be good to arrange a regular weekly sked? I shall be on 70.450 around 19.30 and then QSY to 51.700 at 200.00hrs for Jack. I'm not sure of Jacks approximate location (I'm not very good on the locators yet) I am in the village of Cotton, about halfway between Stowmarket and Eye.

Hello,

I have been listening on 4 and 6 metres, but not been able to hear anyone. I could faintly hear a voice on 4M, but all I have received on 6M is noise. I would have thought I would be able to hear Iain as I am quite close to him, but I can't! Maybe a path issue?

I'm fairly sure my radio is working correctly!

Jack.

Jack, great shame we couldn't hook up, something to aim for in the future for us all. As far as 4m, I think a success can be claimed, as usual I worked Derek m0JMV, and good to work Iain G0OZS for the first time, and the addition of Mark 2e0TNG/m popping in albeit only just making contact with myself, but a good start for a first time on 4m!! Good stuff, and thanks to all for participating, and hopefully we can do this again. Activity breeds activity, let's try and build some momentum.
Andy, 2e0diq

Hello,

After the failed contact, I did get on the local repeater to try to call for someone to assist me with some tests. Thanks to Nigel G7MVU, Jake G1YFF and Daz G7SDC who helped. I can confirm that the 351, the amplifier and my antenna are all working fine. I assume the issue is likely a pathing or background noise problem, which is why I was unable to hear anyone. I was also told that my antenna may benefit from being slightly higher. At the moment it is about 30 feet in the air. It is a tri-band white stick.

Maybe we could try again at some point? Perhaps if I was out portable in a different location, that may make a difference?

Jack.

M0HER.

Jack, do you have a receiver or other that you can measure your noise floor? I suspect that we are far enough away to be buried in the noise? 30feet should be ample height wise, I wonder if the white stick tri-bander is efficient enough on 6m, it's a 1/4wave there I believe? I prefer dedicated mono band antennas personally. Where I could hear Iain on 4, he (and I) was inaudible on 6m, disappointing. I think if you put up a 70mhz antenna, we should hear you, or at least stand more chance. Of course, I'm willing to persist in order to make a contact with you, the little green radios do work very well. All the best, Andy 2e0DIQ

Hi Andy,

I don't have a receiver available. I don't have a huge amount of equipment available to me. The best thing I have is a Yaesu 847 that a friend has lent me.

I don't know how efficient my antenna is, but assume that a tri-band is not as good as a mono band. I did hear someone very faintly on 4M, but I was unable to understand what was being said. I would have thought that I would have been able to hear better, even though the antenna is not for 4M. I have spoken to some people, and I may be able to get a 4M antenna up at some point.

I have had an extended chat on the 351 to my friend in Bury, so I know it is working properly!

Jack.

Jack, do you have a receiver or other that you can measure your noise floor? I suspect that we are far enough away to be buried in the noise? 30feet should be ample height wise, I wonder if the white stick tri-bander is efficient enough on 6m, it's a 1/4wave there I believe? I prefer dedicated mono band antennas personally. Where I could hear Iain on 4, he (and I) was inaudible on 6m, disappointing. I think if you put up a 70mhz antenna, we should hear you, or at least stand more chance. Of course, I'm willing to persist in order to make a contact with you, the little green radios do work very well. All the best, Andy 2e0DIQ

Hi there Good luck ! What set up are you using ie which radio 351 or 352 or 353?
What antenna? Will you be on 4 or 6 metres? What times
I am located in Filey and if you can advise regarding the above. Four metres is probably the better bet to reach the East coast.
I will put up my Clansman 4.5 metre mast and GSA plus the 352 and that should work to Sutton Bank
Unfortunately on the Sunday for at least the morning I will be marhalling at a sponsored walk so will not be able to listen at that time.SO I can be around on Saturday (with the domestic CEO's permission :-))
If by any chance you have D Star let me know. You could find me on the repeater located on 145.6 (GB7RW) . It is located in Robin Hood's Bay and you are line of site from up on Sutton Bank.
Cheers
Stewart

Greetings

Ian, MØYMK and Robin GØGNE are off to EAST KIRKBY Where is situated the Lincolnshire Aviation Heritage Centre http://www.lincsaviation.co.uk/ <http://www.lincsaviation.co.uk/> to view □Just Jane□ the Avro Lancaster and other stuff. Leaving Surrey at 0800BST and arriving at a loose 1200BST. We will be armed with 50Watts of radio on the way up theM25 (West) A1, M1 and into Lincolnshire, So get out those 351□s etc and see how you do! Main frequency will be 51.700Mhz as we have hands free on that frequency . I can only use 70.450Mhz static from a TRA967 into a 351 20W amp!

Sunday we are off to the http://www.dambusters-hamfest.net/ at Thorpe Camp nr CONINGSBY . Hope too see you all there, Weather looks good!

My own idea would be to get a 5.4m mast, and make an end fed dipole to pop on top, cheap as chips. I'd make one for 4 and one for 6m, and swap as required. That's just me being tight though. I grudge paying inflated prices for something that I can make at least as good, though not "authentic".

Hi

I plan to make and use a slim jim (sort of folded dipole) suspended from the top – I do that already for 2m for my GB2RS news readings, with one of the cheap 10m telescopic fibreglass poles as a support. It generally worked better than the white stick collinear on a Clark mast that it replaced at my previous location.

The advantage of that antenna is that it can be suspended from the top end when in use and rolled up when not in use ! It is alleged that the slim jim has a flatter radiation pattern than a vertical dipole which may be of advantage in flat country where skyward radiation is wasted on VHF.

Regards

Iain

Hi Jim, Referring to H612, Technical description EMER pages 51 and 52, on receive there is an 85Hz tone injected into the control PCB 2a, this is superimposed on the rx signal, when the received carrier is strong enough the tone is detected on PCB 2c and the rx squelch is lifted, the 150Hz tone sent by other Clansman sets also lifts the squelch. The 85Hz receive only squelch tone is adjusted by R43 on PCB 2c, what I have done on both my 353 sets is to adjust R43 till the squelch lifts with no rx signal then back it off so the squelch drops the audio out, when I tested the sets with my Sig-Gen I found a 1.4uv signal lifted the squelch.
PCB 2c is located under the cover where the 3 audio level pots can be seen.
The pot marked T can be used to turn off the transmitted 150Hz tone which can be heard quite clearly by the station the other end and can be distracting, I turned off this tone on all my FM sets.

Can't help you on this sorry, but one question on this matter from myself. Given that the radios are predominantly 4/6, and will operate from 30mhz up, are the antennas (battle whip and the fold out whip) suitable to be used below 30mhz? I know it's close, but never the less it's still an extra gap, and I do wonder how well that would perform?

1191. Re: Advice on Radio

From: Stewart Gebbie
Topic: 1179 Message: 1191

The antennae are designed to work at 30-76Mhz. The battle whip is not that great. In the case of the EK GSA , I tested it at 29.6 Mhz using my frequency analyser and it was certainly under 2:1 SWR. These antennae do dissipate a percentage of the power as a trade off for decent matching over such a wide frequency range.

I like to think of these antennae , to be a bit like having a resistor of about 50 ohms with a bit of wire attached. It will radiate, and will match perfectly but not very efficient. The pineapple is a good example that dissipates a fair amount of the RF energy.

Cheers

1193. Going out with the 351/2

Yahoo group: Clansman351
Date: 2014-05-25 20:51:26 UTC
From: ajctrees@...
Topic: 1193 Message: 1193

Took the 351/2 out with me today on a trip to the coast. Stuck a 4m mini mag mount antenna on the roof and called on 70.450. As I neared Norwich I picked up a station in the city and we had a qso for about 5minutes or so. The antenna is probably not the best as it's heavily base loaded and a very short whip. But it's less conspicuous and clumsy than a full size 1/4wave whip on a small car. It actually worked surprisingly well considering, and I'll take the radio out again with me as a mobile unit and see who I can work.

Hi all
We will be at Sutton Bank and will be operating with a Scarborough Special Events Group callsign, GX70OOO on Sunday 8th June from 10H00-15H00.
If we get on 60 metres it will be with my own callsign. THis is a commemoration station for operation Overlord / D Day
Most probable frequencies are 7155KHz, LSB and on 70.45Mhz plus possibly 50.7Mhz FM.
Clansman radios will be operating (too heavy to lug a 19 set as I have tennis elbow !)
Note no 2 metres perhaps other than a handheld.
G0OII will also be in attendance and operating
Cards will be sent via the Buro for all contacts. The route for anyone requiring a direct card or any listener reports is via G0OOO

Regards

Stewart G8YQN

Hi there As I am somewhat of a numpty at painting radios., my approach was to use the Clansman Green in the spray cans from a company called Fascinating Finishes in Hull. I have always painted the radios in the summer so the temperature was 20C or more . I also used etching primer to ensure a good "key" on the casings of 320's.
The finish is not perfect but it is a lot better than the battered originals.
I have done a 19 set key kit and that came out quite nice (I used Olive drab green for the 1940's gear)
Cheers
Stewart G8YQN

Hi Geoff, I cannot help with the thinners, but if your paint is from
Fascinating Finishes you could contact them and ask:
E-mail: info@...
01482 342216

I gather they are pretty good with help and advice.

1207. Homemade atu

Yahoo group: Clansman351
Date: 2014-06-10 17:14:29 UTC
From: ajctrees@...
Topic: 1207 Message: 1207

Finally, I have finished my toroidal atu kit. Now I'm not the most able at making kits and following the circuit diagram with no instructions proved a challenge for me, it's the first time I've had to do this. I had no prior electrical skills before taking my 2e0, and referring to the chart to check components, checking resistor values etc were a good refresher. Winding a toroid was something new as well, and getting the joints clean onto the 12point switch seemed harder than it should have been. Overall I'm pleased, I set it up on the 70mhz with the SWR, which was fine, then set the 351/2 to 51.5 and matched the antenna to about 1.8:1 on the 4m endfed. This means I can now use one antenna for the clansman, freeing up valuable antenna space for other projects. I can also take the atu /p as it's very light and compact, and will match through HF to 6m. But for now I'm just pleased it works on 50mhz.
Andy 2e0diq

Topic: 1207 Message: 1208

Slight misinformation on the last post, I revised the windings of the toroid to suit 6m, rather than covering the HF band. I thought it would cover all HF + 6, but it won't. Not a problem, for the money it cost I could knock up another if needed. Andy 2e0diq

Hi Stewart, I'm primarily using the 4m endfed dipole for most 4m contacts, with the atu it will match to 50mhz, I'm not claiming it will be the worlds most efficient antenna for 6m, but it will make it safer to transmit without damaging the radio. I do have a 6m endfed as well, but as many others find, space is a premium and compromises need to be made. 4m is the more active band, so get priority. Andy, 2e0diq

The white one is my 6m, and the other is the 4m. Basically it's fed at the bottom (end) and then both halves of the dipole are above the feed point. A choke is at the base, easier to see on the white one. The end fed is made by having one 1/4wave of coax with outer intact, then the top quarter is stripped to either use the inner or solder a wire to the inner to save wasting coax. I'm not the best at explaining the detail, but a search on the web will bring it up. Hope the images post ok! Andy 2e0diq

Andy

I would probably call it a sleeve dipole – it is the efficient single frequency relative of the Clansman EVHF

It is also possible to feed a ½ wave (or nearly ½ wave) single element from the bottom using a parallel tuned circuit for matching; in that case the antenna and ground are connected to opposite ends of the tuned circuit and the coax inner is connected to a tap something like 10% up the inductor from ground. Peter G8BLS in Ipswich is the local expert on building these for the higher HF bands

Regards

Iain

Hello everybody,

My name is Luca IW7EEQ from Taranto (Italy) and I am a happy owner of PRC-351.

I am happy to have joined this group and probably this is not a good moment to post my question (after the football macth England – Italy hihihihi).

Jokes apart, I would like to ask to some of you if you know what is the trimmer on modul 14 to set the mic-gain and where I can find the trimmer to set the squelch level.

Many thanks in advance.

Luca IW7EEQ

Hi Luca, you really need to download the Technical Description EMER for the radio, High band is ABOVE 48Mhz, low band is BELOW 48Mhz. One extra point, to receive NON Clansman signals you will need to adjust R2 in module 9 to the point where the squelch lifts, then back it off slightly, this will allow the squelch to lift when a carrier is received from a NON Clansman radio which does not transmit the 150Hz tone squelch signal.
There are several files in the group Files section you need to download.

Hi Luca, if you were just using the whip antennae I would not be surprised if no contact on 70Mhz, you need to try an antennae connected to the BNC socket on the 351, if you have the PA unit (the 352) make sure it's tuned correctly and do not use the SURF unit at all, it is only used if you have several radio's in very close proximity, 70 Mhz (4 metres) is a strange band, several times I have tried that band with a friend about 5 miles away from on top of a local mountain, I can see his qth, no contact, moved further away to about 6 miles and I made contact loud and clear !, if you need to tuneup your 351 you need the EMERs to identify which internal coils and trimmers you need to adjust, plus a signal generator.

Hi Leighton,

Yes I was using the whip antenna!

The strange thing was that I listened me S8 R5 but I did not listen him at all!

I will try the contact with an home made mobile antenna for 70MHz using the BNC socket.

I do not have SURF and PA unit.

Hello Geoff,
I have used one of those with no issues. Just make sure it is of sufficient ratings such as wattage or amperage for the unit. The only thing that I was wondering myself was if there was any extra noise generated by them. In my case, none that I could tell. And, of course, you want to ensure it is fused properly.
Cheers

Hi Geoff, I fitted one into an old 4A battery box. Also I made up a lead to run from the converter box battery terminals to a 2 way power distribution box, which feeds a 28V DCCU and an audio amplifier. Runs fine with no known problems. Note that I am not feeding my PRC320 from the converter, but just charging the battery as would have been done in a vehicle..

Geoff

Yes, the standard 351 is designed to drive two audio devices and any combination can be connected to the two sockets.

Note that there are some differences in the 351M which was designed to have a speech encryptor attached to SKT1 and on a 351/M only the SKT2 works properly with a headset or handset – at least on mine SKT1 needs much higher “microphone” levels to get a useful deviation, but the audio passband is increased from 3 to more than 8 KHz.

Regards

Iain

HI there

I went and double checked and every member has access to the photos and files area. This must be an issue at your end.

Can any other member who is accessing from outside of the UK advise if they can access the files and photos area.

BTW . A lot of nice photos are on the site.Thanks for all the submissions

Cheers!

Hi all,

I am willing to buy the R.F. 20W unit for my PRC-351.

As I have read and undestrood once installed the rf unit I can only use an external antenna and not wthe whip antenna.

Is that right?

Thanks

Yes that is right, there is an antenna port on the side of the amp which is the 20 watts RF out.

Yes, this is true, due to the power handling capabilities and impedances of the whip. Use the port on the amp to a GSA or other 6m/4m antenna.

Luca

Officially (and I think correctly) it needs an external antenna like the GSA or a vehicle with the initiate box and TUUAM to tune a whip.

I am told by a former user that it was occasionally done as a field expedient by fitting the 4W SURF selective unit (band pass filter) which has both BNC and Whip antenna connections on top of the 351 and connecting the PA output to the SURF input, after first tuning the SURF at 4 watts.
Whether that is good for the SURF unless the antenna is perfectly matched (which the whip generally isn☐t) I doubt !

Luca

It will work OK, but is not as good a match as a GSA or a ¼ wave if always used for a single band. The main benefit is that it will cover 30 to 76MHz without retuning if the antenna is not easily accessible in use. You will need to mount the pineapple base into a vertical 25mm tube. I actually bought a spare section of 5.4m mast fibreglass tube from Steve M0SLK and used that to make a base that was mounted to the side wall of the shack at my previous QTH. See also http://www.g0ozs.org/clansman/EVHF/index.shtml

Date: 2014-07-30 08:01:24 UTC
From: ajctrees@...
Topic: 1257 Message: 1257

I have lost transmit on my headset. I have incoming audio, beautifully clear as always, it keys up on AM and de-keys faultlessly. But it carries no audio. I've put my lightweight headset in line thru same pressel and there are no issues, suggesting the fault is above pressel to headset. I've sprayed a squirt of contact cleaner into the plug, to no avail. I'm guessing a wire in the lead or headset has failed, but have no idea where to look inside to source the fault. Ideas please? I love the received audio on this headset, and would love to repair it.

Hi Andy, I am guessing here but does the Amplivox microphone circuit
require power to operate??
Is your pressel black in colour??
The green pressel passes power to the headset, the black (older) does not..

Possibly its a cracked track on flex or dry solder joint on SK2 socket. See it first but be careful as everyone knows flex tape ageing causes it prone to breaks.

Boring wet day, Bank Holiday in particular, what to do? Packed the 351/2 in the car and set out on a journey around East Suffolk. First port of call was Woodbridge, calling on .450 at 10min intervals throughout journey. Silence. Had some lunch and headed onto Felixstowe, again called throughout journey at ten min intervals. Silence. Picked up some more food (chips from the seafront, radio builds up an appetite) and proceeded to land guard fort viewing area. Put another call out and got G8XRL. Happy days!! Then Derek M0JMV called in, bit of a surprise to say the least!! So then we formulated a plan to see if I could maintain contact on my homeward journey. This involved me calling junction numbers as I approached them, in order for him to track me with his beam. We were joined by 2e0fbd Dave, (non-clansman). The difference in the audio between our clansmans and Daves Anytone while weak signals was evident. I copied enough of M 0JMV audio to fill in the missing bits, I couldn't do this with Dave, the audio was just too soft. My antenna is magmounted, helically wound 1/4wave on the rear of the roof. Fantastic experiment, fantastic fun, and once again proof that the Green radios do the job they were designed for. Also ran 20w for the duration of the journey.

Hi all, As a NEW person to radio can I ask a question that has probably been asked 1000 times! Can a 351 run on 21.6 volts from 3 packs of NiMH subC racing packs?
Also what is the settings for .450 I have yet to receive any thing on my 351 outside a mate calling up from adjacent tent.
Thanks for any guidence.

Hi.

Why not just get a proper battery? Vast selection of it on the ebay

It will run on receive but it'll be troublesome to run on transmit as the voltage drop on nimh batteries is just too large.

It must be a creack in a track as both sockets use the same feed so I
have put in wires from one to the other
is now working fine can still buy t□he parts for the clansman radios but
this saves time thanks
Ian

The frequency (4m calling channel) is 70.450, best chance to hear anyone. If you're using the battle whip, I doubt you'l hear too much beyond a couple of miles. I use a 4m 70mHz Ampro mobile antenna on a mag mount for good mobile contacts. If you're not a licenced ham, don't use the radio. It was a great motivation for me to take my Foundation and then Intermediate.

Hi thanks for that we have taken our Foundation exams so that is Ok,
putting together army whip aerial and tuner etc on our Austin truck. At
the moment vehicle mechanics 1st priority Radio second but will listen
out when on the road/green lane.

Well congratulations on the new callsign, and welcome to amateur radio. I get a lot of fun out of my clansmans, including 70mhz on the 351/2. Activity breeds activity, if you start calling out on 70.450 you should generate some replies, there's quite a Few licensed listeners out there!! My tally count on 4m is currently 35 individual contacts around E Anglia, and a /m in W Noraway (my best 4m moment) so just because you can't hear them doesn't mean they're not there. I'd say that most of my contacts have been the result of a CQ call on .450.

Hello Group Alex VK2HAS I am the owner of a couple of 351s and have been for some time. These are truly fabulous radios. Today I decided to give one of mine a treat and take it on a bush walk in its backpack bergan, hand set in my top pocket, frequency selected to 52.525 the primary FM simplex frequency and off I went, up hill and down dale, over creeks and through bush. Every 10 min or so calling CQ and begging anyone to please just say something. I saw parrots, wallabies, lizards, and even other bush walkers who I suspect thought I was mad! Hey I looked the part! I sat on rocks and pleaded with the static to stop and say something, anything, no, it just kept on hissing. I turned it on and off a few times, said nasty words to it but to no avail, it only new one word "Hisssssss" It was like being the only person left on the planet! I got so angry with it I told it I was going to take it home if it didn't speak, It just looked at me and said "Hisssssssss" I Hisssssed back! It didn't care, it just looked at me with that blank green face and you guessed it, Hisssed. I have had more fun watching grass grow. In frustration I took it home and put it to bed!
Was good exercise, I needed it! Was a good lesson, No one uses 6 meters FM especially where I live, Having a single radio with no others in the area or licenced friends with similar sets is a wast of time. Next time I feel the urge I'll take my 320 instead.

Hello Alex,

Good plan...I find, even in a densely populated country like UK, to get a contact with the 351 in the manpack role you would need to be within five miles of some other known stations who you had pre arranged skeds with. I placed a vox recorder on the 4m channel here for some time to gage activity and make contacts....I found the Rig works best as a 352 groundstation with a high gain antenna. Beam or colinear.

Regards, Stu G4IYK

REgards,

Alexander, Stu

We have had some QSOs between stations with 352 and 353 here in West Suffolk but needed elevated antennas - I think the longest path worked is about 22 miles between 352 and 353 with elevated resonant antennas and high power.

I'd agree that 5 miles in flat country is probably the limit for the whip antennas - the other factor in trying to communicate with non Clansman sets is 150HZ squelch operation - at least some sets seem to have had the Local Squelch tone injection to the receive path turned down so that the sets appear very deaf to non 150Hz signals unless the OWL* switch is set to * (noise) - I was unable to hear an amateur 6m 2.5w transmission at 30 yards on a 352 until I switched to '*' in one test! Unfortunately leaving it on * hurts the ears and annoys kids and pets so I think I need to find the adjustment inside ....

Regards

Iain

Aye agree. I had some success this year working Derek, M0JMV on 4m at a range of 70Km - his 353 and 50 watts and my 352 - Beaming between Gravesend and Sudbury. I often hear Derek calling but time constraints have kicked in so we have not taken it much further. I keep a rig on while in the shack unless the squelch is lifting in and out. I wondered if leaving the tone squelch on would have improved the QSOs with Derek but it was too late I'd already turned it off on both of my sets. Leighton GW3FSP has published a squelch adjustment on this group and recommend locating the squelch after removing the tone and then setting it.

Good fun though...

With the help of this group I concluded the VHF Range of these sets is far in excess of the military capability if you use a decent antenna with gain, as opposed to the the military antennae, deliberately designed to limit the range in order to both standardise and avoid the chance of intercept. (NB I accept when the military standard antenna is operating at height - anything is possible and the humble 349 with its whip can produce some very surprising results).

The set behaves much differently in amateur use than in its military role.

Subject: Re: [Clansman351] Fantastic field day with my PRC351

Alexander, Stu

We have had some QSOs between stations with 352 and 353 here in West Suffolk but needed elevated antennas - I think the longest path worked is about 22 miles between 352 and 353 with elevated resonant antennas and high power.

I'd agree that 5 miles in flat country is probably the limit for the whip antennas - the other factor in trying to communicate with non Clansman sets is 150HZ squelch operation - at least some sets seem to have had the Local Squelch tone injection to the receive path turned down so that the sets appear very deaf to non 150Hz signals unless the OWL* switch is set to * (noise) - I was unable to hear an amateur 6m 2.5w transmission at 30 yards on a 352 until I switched to '*' in one test! Unfortunately leaving it on * hurts the ears and annoys kids and pets so I think I need to find the adjustment inside ....

Hello Alex,

Good plan...I find, even in a densely populated country like UK, to get a contact with the 351 in the manpack role you would need to be within five miles of some other known stations who you had pre arranged skeds with. I placed a vox recorder on the 4m channel here for some time to gage activity and make contacts....I found the Rig works best as a 352 groundstation with a high gain antenna. Beam or colinear.

Regards, Stu G4IYK

Hello Group Alex VK2HAS I am the owner of a couple of 351s and have been for some time. These are truly fabulous radios. Today I decided to give one of mine a treat and take it on a bush walk in its backpack bergan, hand set in my top pocket, frequency selected to 52.525 the primary FM simplex frequency and off I went, up hill and down dale, over creeks and through bush. Every 10 min or so calling CQ and begging anyone to please just say something. I saw parrots, wallabies, lizards, and even other bush walkers who I suspect thought I was mad! Hey I looked the part! I sat on rocks and pleaded with the static to stop and say something, anything, no, it just kept on hissing. I turned it on and off a few times, said nasty words to it but to no avail, it only new one word "Hisssssss" It was like being the only person left on the planet! I got so angry with it I told it I was going to take it home if it didn't speak, It just looked at me and said "Hisssssssss" I Hisssssed back! It didn't care, it just looked at me with that blank green face and you guessed it, Hisssed. I have had more fun watching grass grow. In frustration I took it home and put it to bed!

Was good exercise, I needed it! Was a good lesson, No one uses 6 meters FM especially where I live, Having a single radio with no others in the area or licenced friends with similar sets is a wast of time. Next time I feel the urge I'll take my 320 instead.

Alex VK2HAS

Hi Group,

Now that many 351s are out of their comfort zone (in terms of spares, expertise etc) are there any parts that would be a good investment to the civvy user? Is better to obtain individual parts or look out for a few complete non-tested/broken radios?

What does BCN mean near the serial number? is there a way to use this to find the age of the case?

Hi there, I would suggest you try and grab a few cheap working sets for spares, at least then you will have working parts available to swop between sets for fault finding if one set dies. A while ago I managed to buy a load of parts for various Clansman sets, I have listed these parts in my folder in the files section, going down a bit!.

Good suggestion. for those UK folks the RSGB National Rally is on at Newark this coming Friday and Saturday. I have no affiliation and not even an RSGB member. The reason I mention this is that there was a LOT of Clansman stuff for sale on the "fleamarket" outside of the main hall last year and I picked up a lot of very well priced spares. It was worth going thee just for these bits . VMARS is thee too
I will be there hopefully on Saturday ready to haggle for more bits
Maybe see some of you there. I will wear my VMARS badge with my callsign on it.

hi 351/2 group

i have two 352s and now have just invested in a ground spike kit of Ebay ya i no
And have tried it out and found the cable is broken somewhere don’t no if its the plug end as yet
but a have another cable to use but what i am after is the ground spike antenna base.
should it have resistance through the base or not as i am not getting anything on the meter
is this right or do i have a problem with the base as well ??

thanks for any help on this

And i am up for any sheds in the west wiltshire or more or as far as the radio will allow

And just a quick one on me i also have a 320 and like to get out and about with that as well
best place i like to go is up onto the Westbury white horse or walking over salisbury plane when the red flags are down.

thanks for any info on this.

Not sure of your answer, Simon, but I do have a couple spare if needed.
(no guarantee!)

In use they are brilliant, we used to use them with the 351 alone, and
they work well with the 349 and the co-axial adaptor from the TKC (yes
I have those also!)

From: Stuart Dixon
Topic: 1288 Message: 1291

Hi Simon,

For the discussion I am sure you should be able to see if the antenna is functioning by taking an SWR reading. I have never analysed the antenna but I am sure somebody in the forum has and might tell you what the SWR should be for any particular frequency and number of elements.

I am interested in the circuit and the correct operation of the device (having never read the manual :0 but taken it for granted, and like Mike says very occasionally tested the device using the issued test kit many moons ago. I have one around here but have never dissected it - I just assume there is a matching circuit.

Have you had much luck with the 320?

1292. RE: [Clansman351] ground spike

Yahoo group: Clansman351
Date: 2014-11-02 19:18:17 UTC
From: Iain Moffat
Topic: 1288 Message: 1292

Stu, All

It is quite closely related to the broadband HF verticals (CHA-150 etc) that use a 9:1 UNUN at the base - the matching network is basically a step-up autotransformer. EMER Tels L212 describes it thus:

Looking at the diagram the coax inner goes to a parallel network of 30pF and 18 Ohms which feeds the transformer tap; one end of the transformer is grounded and the other end feeds the antenna element via 22pF

So I would expect and have measured a resistance of 18 ohms to ground and the antenna socket to appear open circuit with respect to both the coax inner and ground.

The coax outer is directly connected to the ground spike and the resistance between them should be nearly zero after the surfaces have been cleaned.

Regards

Iain

hi all thanks for all the info

i have put a SWR meter on it and 70.1 is 1.5 and 50.1 is 1.6 so not to bad and the power output is 20w on 70.1 and 25 on 50.1 good there
and have tried it today with 2E0EME who is not to far from me he was on a hill with the ground spike and i was on Westbury whit horse
with a ground spike and as the crow flies about 12 miles from hill top to hill top we can mrs or less see eachother so not that much in the way
but i hear him like a good 5/9 but he can’t hear me. not even on the whip antenna. but i have talked to someone in wales who had a beem

and i have tested the mount and its zero on the meter so don’t no

and as for the 320 love it i had a friend sort it out just before the test rig went to the scrap man

thanks for your help on this everyone

The RX is fine but listening on another radio, a blank carrier sounds very noisy. I have tried many good handsets on both sockets. The problem must have happened fairly suddenly because the radio was working not too long ago. Is this something fairly common? Both my '351 now have this fault., and I would appreciate some help!

Bit worrying. At that range and LOS you'd expect a 2 way qso on the whips. I suspect his rx is deaf or the squelch isn't set up properly. Good going with the 320 -

Subject: Re: [Clansman351] ground spike

hi all thanks for all the info

i have put a SWR meter on it and 70.1 is 1.5 and 50.1 is 1.6 so not to bad and the power output is 20w on 70.1 and 25 on 50.1 good there
and have tried it today with 2E0EME who is not to far from me he was on a hill with the ground spike and i was on Westbury whit horse
with a ground spike and as the crow flies about 12 miles from hill top to hill top we can mrs or less see eachother so not that much in the way
but i hear him like a good 5/9 but he can’t hear me. not even on the whip antenna. but i have talked to someone in wales who had a beem

and i have tested the mount and its zero on the meter so don’t no

and as for the 320 love it i had a friend sort it out just before the test rig went to the scrap man

thanks for your help on this everyone

simon

It is quite closely related to the broadband HF verticals (CHA-150 etc) that use a 9:1 UNUN at the base - the matching network is basically a step-up autotransformer. EMER Tels L212 describes it thus:

Looking at the diagram the coax inner goes to a parallel network of 30pF and 18 Ohms which feeds the transformer tap; one end of the transformer is grounded and the other end feeds the antenna element via 22pF

So I would expect and have measured a resistance of 18 ohms to ground and the antenna socket to appear open circuit with respect to both the coax inner and ground.

The coax outer is directly connected to the ground spike and the resistance between them should be nearly zero after the surfaces have been cleaned.

Hi Simon,

For the discussion I am sure you should be able to see if the antenna is functioning by taking an SWR reading. I have never analysed the antenna but I am sure somebody in the forum has and might tell you what the SWR should be for any particular frequency and number of elements.

I am interested in the circuit and the correct operation of the device (having never read the manual :0 but taken it for granted, and like Mike says very occasionally tested the device using the issued test kit many moons ago. I have one around here but have never dissected it - I just assume there is a matching circuit.

Have you had much luck with the 320?

Hi Simon,

If anything the surf isn't required in a single set installation. Your setup is technically correct. The guy on the 320 forum must be an imposter or you are reading some old posts Haven't been there for some time. www.clansmanradiouser.org

Interesting you should ask, there are a number of nets that form up in various parts of the country. I am sure you could go portable on HF, four or six meters but it would be wise to use clansmanskeds (the yahoo group) to arrange some contacts first. As far as I know Clansman Day doesn't exist.

Regards,

Stu

From: Stuart Dixon
Topic: 1298 Message: 1301

Hi, it does matter. And it sits between the set and tuaam. I would consult the various manuals for the intended mode of operation. If you choose to initiate tuning in some other way it might be eliminated. G4IYK Said that

Topic: 1294 Message: 1302

Hello,

You seem to have determined the mikes are not at fault by trying several. I would determine if the noise is coming in from the handset/headset, by disconnecting the mike and keying the PTT. Short pins F to E to key the PTT.

Try this on each of the two audio sockets on the radio. They should behave the same. I have found many of the headsets and handsets that have poor internal connections. Some Deoxit spray, and manually tightening and exercising the connections inside the devices has cured all the problems. I think I have had to open up every one of my Clansman audio devices at least once!

If there is no noise on the carrier then you know the source is from the radio connectors or the audio device. (But you have probably ruled out the audio device). The connectors on a PRC-351 tend to get dirty. Flush them out.

If there is still noise on the carrier then the problem must be internal to the radio. I have chased intermittents in a PRC-351 (transmit audio) and it's hard to do. I would try to find mechanical problems first. Poor contacts and corrosion has been the common source in PRC-35's I have worked on.

Have you disassembled the radio? Being careful with the flex circuits, look for poor connections, etc. You can even loosen and tighten ground screws, cover screws, or unplug and replug modules and maybe find an intermittent.

If no success so far, you might have to swap out modules to find the noisy one.

hi group

thanks for all your help on the antenna base i have no idear what was up with it but i was up on the hill with it
a friend was on at the same time we had nothing both ways. and don’t no what happened i did nothing just about to give up on it
and bang it worked SWR went down to 1.3 from 1.6 on 70mhz so i can’t think something went wrong somewhere

so thanks for all your help on thins

me simon 2E0MEF and paul 2E0EME will be out on salisbury plane on the west side high ground on this sunday the 9th from about 12.00 midday we will be on the clansman skeds 80/40/6/4

hope to catch you soon

I dont see why one person is able to intimidate all the remainder on a group!

If that person is identified then tell the moderators. In the case of groups I moderate I will eliminate them - well speak with them first as I dont belong to ISIS!

?

I ditto Leighton's comments. I am fairly new here but have found all of your submissions and comments of value. This is the whole purpose of a forum. Any negative comments made by anyone related to the topic at hand should be considered constructive criticisms in the very worst case.?
? ? ?Leighton, please do not leave as our focus here is quite specialized as it is, and any help is appreciated. If grown people can not handle for example, a bit of sarcasm or criticism, then they themselves should not be on a "forum".?

Iain, As far as ?I am ?personally concerned?I have not seen any posts in any of the groups I am a member of in Yahoo which are in the slightest critical of your contributions, I would urge you to continue as member of any group you are a member of, if your post ' disturbs ' the complainant all that person has to do is ignore it or delete it, I fail to see why you should be ' bullied ' by this individual into leaving, he should leave.
As for ' email hygene ' I am at a loss to understand that expression.

Leighton. ? ?GW3FSP.

I'd like Iain to seriously think about joining us on the board at the clansman radio user.
 Or at least take up authoring for us.

Personally, Leighton, I think we have enough groups already - even too many.
One for Clansman would be quite enough, well may be one for manpacks and
one for the other, but just leave it as it is, it works fine!

This is the answer I gave you about 6 months ago to the same question:

" Hi Geoff, I cannot help with the thinners, but if your paint is from
Fascinating Finishes you could contact them and ask:
E-mail: info@...
01482 342216
I gather they are pretty good with help and advice."

Dont worry, Mike, its the age in which we are living.

I get fed up with saying to people, to whom I have sent an email, did you get it as so often they dont bother to reply even, let alone to say thank you!!!!

A Personal view is that it is ignorant not to even reply, then I think , well, people just dont care any more, so it seems.

I know selling things is just a transaction and what does it matter to say thank you its arrived - but many dont!

Topic: 1353 Message: 1353

Hi all
This group links all together in our common interest in Clansman radios.
We do not often get the opportunity to talk as we are all scattered across the UK , Europe and the globe!
One thought is that if any of you have D -Star (yes that filthy modern stuff) then we can connect and talk .
D Star (in Europe, Canada, Australia , New Zealand) now has callsign routing and you can quicky get a DTMF code for your callsign. This means you dont have to know which repeater or where the person is but you can connect to them . Just dial them on your DTMF microphone on your D-Star rig !
Just a thought that might be helpful
Cheers

Hello Stewart, I know nothing about this but I am interested in the concept. The 351 is a great radio and it would be great to talk to others using 351s, tell me more! Would you require a special mic?

From: Stewart Gebbie
Topic: 1362 Message: 1364

Another possible source is this site which I believe is run by Steve.
There is not one listed but he might have one in a scrap set.
A switch in itself failing so catastrophically, would make me suspicious that there is another underlying fault. Have you tried just bypassing the switch to see that the radio still works?
Cheers

Hi Ian

You can just solder in a replacement fuse wire in between the posts, the green board is the motherboard and isn't replaceable as all the modules are soldered on to it

Just added two photos of my now missing Mine detector kit, disappeared from a Hermes depot in Stafford sometime after the 19th march where it was last tracked, if any of you guys see this kit anywhere please let me know asap.

Thanks guys. Leighton. GW3FSP.

1375. 351 SURF Question

Yahoo group: Clansman351
Date: 2015-04-09 00:58:33 UTC
From: munsterdunster@...
Topic: 1375 Message: 1375

Can someone tell me the value of the variable capacitor in the 351 SURF unit please?
Thanks
Paul

it is only good if you are using another 351/352 close to you
thats about it other than that it looks alright

Thanks for the reply Ian. I am rebuilding the unit as another device, not a SURF but I need to find out the pF of the variable capacitor. Hoping someone has specs or schematic with its value.
Cheers
Paul

Hello Paul, If you can remove or gets some leads to the Variable Cap you can use a modern digital multimeter with the appropriate Pf scale to measure the value, I have done this in the past.

Hi Ian,
looking at the second pdf, it seems that the 351M can be used for wireless telegraphy. I have connected the handset GS and a telegraph Key Manual. It doesn't seem to work. Is the BID250 required for wireless telegraphy? The document makes no mention of this.

1385. IF issue

Yahoo group: Clansman351
Date: 2015-05-08 17:30:02 UTC
From: m3tmh@...
Topic: 1385 Message: 1385

Hi Group

It looks like I have an issue with the IF adding itself to the Tx on a 351. I have reflowed the solder on pin 10 of module 10, but the problem still stands. Is there a way to manually connect pin 10 to wherever it needs to go with a bit of wire? I'm not looking forward to stripping it down again, but I don't want to lose the radio if I can help it. I'm also looking for another Module 14 if anyone knows where I can find one!

Hi all, Well I am in North Yorkshire and it would be almost a miracle if I hear you on 4 metres !!!
I will be on HF this afternoon on my 320 on 40 metres so if anyone wants to try a Sked I then let me know.
I will be operating kind of portable i.e. from my summerhouse with my 90 foot long folded dipole. This gives me solid UK coverage so if I can hear you then you will hear me.
Cheers
Stewart G8YQN
PS I might put the call sign GX7OOO/P on the air so listen for either callsign

I wonder if you guys had any joy on your road trip in Essex? I put some calls out with the beam pointing towards Essex this morning around 11-12 am. I did wonder if you were also active on GB3CE as I heard two /m stations active there, but as someone in their wisdom put GB3YL on the same frequency the two repeaters were all over each other. For that reason I wasn't able to work anyone thru CE. Not knowing your callsigns made it a little tricky too. 73s de 2e0diq andy

Hi there, Geoff, Sorry to be so slow in replying as I have been so busy with work. I am pleased to see you are back in Clansman world
I wondered why you never mentioned Sutton Bank. I was up there about two months ago and late last summer.
Worked folks on HF on a 320 with the Clansman inverted V using a Clansman 5.4 metre mast but not a sausage on 4 metres. At least we had a nce snack in the coffee shop.
Let us know if you are going up to Sutton Bank. I have a big antenna stretched out in the garden mounted on Clansman 5.4 metre masts so its good for HF especially 60 and 40 metres!!
Its total wire length is 180 feet approx . Its a 90foot long folded dipole
Cheers

Last night I walked out about 2 miles from my home qth. I set up the 351 with the 1.2 m whip in the top of the radio and worked M0JMV Derek at his home, a distance as the crow flies of some 24miles. We held a qso for around 30mins, he was running the 353 his end. We operated on 70.425 having established contact on .450. I was using 4w. I did find that the whip needed to lean in a NE direction to work best in a SW direction. Very pleased once again with the set up.

Last night I ran a bit of an experiment with the 351/2. I'm approx 24 miles by crow from M0JMV Derek, we can work each other ok on 1.2m whip, so I set up a GSA and an inverted v dipole at 6m. Neither of these matched the performance of the 1.2m whip, both returning a very weak signal on 70MHz. This begs the question why? The GSA is mentioned as being capable ofimproving transmissions, but it clearly didn't. I know given the distance that I'm expecting a lot, but if the 1.2 can perform surely the others should at least equal? Incidentally on the inverted v and the GSA I ran 25w, and the 1.2m 4w.

Hello, I guess this could be an example of the difference of radiation patterns, and/or feedline losses. I guess with the feedline loss issue, you did run more power on the dipole or GSA on TX, but losses would still affect your RX. The inverted V would definitely have a bit of a directional characteristic. Did you try multiple positions for the inverted V? Also, how was the VSWR on all antennas? Were you able to measure this?

Well basically I ran with the kit set up as closely as the military spec as possible. The GSA set up as per available kit, with original feeder, vSWR of less than 1.5:1. the inverted v set up with 10m of RG58/u. VSWR on this 1.2:1. I tried firing off the side of the dipole firstly, and then rotated 90deg, making no difference. I have quite some experience of antenna building now, and working /p, so I was surprised (and disappointed) with the results of the larger antenna systems. The 1.2m whip surpassed all of my expectations. I expected far more from tthe GSA, and I wanted it to be better, esp as I take radios to work to operate in my lunchtime and I thought it would be a very portable solution for vhf transmissions. The only use I can see for it is to toast marshmallows by a very hot fire!! Of course, we should bear in mind that these systems are designed to be a simple set up for field use, not for use in the way amateurs like, long range and maximum performance. But it was an interesting exercise, and is something that can be learned from, and in the guise of an amateur operator, experimentation is always an important part of the hobby. 2e0diq Andy.

Personal, in service, experience suggests that the GSA works well spiked into the ground, I dont think I have ever used it elevated.

I think I have also used it with the 349, using the TKC adaptor.

My experience is that the GSA works better than the battle whip. One of the last of the antennae for the 351 was a stiff rod with loading at the bottom and this works much better than the multi-secton antenna and the flexible battle whip. I have used the GSA with the elevation kit and if you make sure you have the right length of coax that comes with the elevation kit then this is good too. The inverted V is supposed to be really good.
I have no expereince with the "pineapple" or the "clothes drier" antenna. I hav head that the inverted V works very well.
That is my threepence worth :-)
I am going to attempt to get the GSA up on 4 metres, this weekend (weather forecast is for rain ...again)
So if anyone is in the Scarborough North Yorks area then let me know and I will be operating from th comfort of my little summerhouse :-)
The weekend of 27th June is Armed forces day in Scarborough North Yorkshire and I will have a Clansman 320 on air with a Clansman dipole on 7095KHz +/- QRM from approx 1300UTC and hopefully listening on 70.45MHz and putting a few calls out too.
Callsign will be GX7 OOO
Cheers

Might be of use to someone using a 320/351 Clansman set in a 12 volt vehicle
or from home without using a 24 volt battery....e bay No.191596497931
Dc to Dc converter 10 to 32 volts input.....12 to 35 volts output
120 watts 5 amps.....works fine on my 320 and the 351 Clansman sets
no weird noises on receive or transmit....Scope shows clean output
can be wound up to 27 volts if required.....

1410. 150Hz RX Mute

Yahoo group: Clansman351
Date: 2015-06-24 09:28:34 UTC
From: hl68ur@...
Topic: 1410 Message: 1410

Hi All

I have a RT-351 which requires a 150Hz tone @ 2KHz to un-mute the squelch , the set has good RX sensitivity and works fine in the * position but that can be very annoying as anyone come across this be for and found a cure.

Regards
Paul

The 349 adapters in the TKCs I have access to are NSN 6625-99-649-5582 and are marked LP. Inside between the radio aerial connection and the BNC centre pin there is a series LC circuit with the C being 6.2pf. Surely this is going to limit the power out into the BNC? Or is there another version of the adapter out there more suitable for connecting to aerials as opposed to the TKC?

Gordon

There is anothger one available, very slightly more expensive which has
a voltage indicator incorporated, switcheable to show either in or out
volts.

If I remember correctly you can adjust the squelch level to all but remove the requirement for the 150Hz tone to be received to trip the squelch, you need to adjust R2 module 11 (Hi band) R2 module 12 (Low band) R2 module 9 either band, with no signal being received adjust (say) R2 module 9 'till the squelch lifts, then slowly twiddle R2 'till the set squelch operates, the set should then 'unsquelch' with low level carriers that do not have the 150Hz tone present.

Hi Leighton

Thank you for your reply and advice.

I have just followed your advice which was broadly what I was doing but thought I was missing something out, I suspect a fault somewhere now and finding it will not be easy due to the sets construction and the lack of a circuit diagram or service manual.

I can adjust the tone level down to about 1.25KHz from 3KHz to lift the mute so something is working, it would probably to easier and more cost effective just to buy a new set but I do not like to be beaten so will carry on.

From: psgebbie@...
Topic: 1428 Message: 1428

Hi All
I put up a Clansman 5.4 metre mast in the garden and mounted the EK-GSA on top.
I connected my 352 and arranged a sked on 6 metres with a station approx 30 miles away. I was very happy that I was heard at 5-5 on six metres in flat conditions.
If anyone is in the Scarborough , North Yorkshire area or on a high point say withing 50 miles then drop me an email on psgebbie (at) sky(dot)com and I will let you know if I can get on air and try a contact. 4 metres should be a good band to try.
I take the antenna down in the winter. It should also be on air with the same set up at the Pickering wartime weekend in October and I will update nearer the time.
Cheers

Hello all,
I am trying to repair an RT351. I cannot find a circuit diagram. VMARS have a number of very useful manuals, but so far no circuit. These are complex sets, and I think we need all the help we can get to keep them running in the long term. Does anyone have a set of circuit diagrams. Failing that, does anyone have a contact in the UK MOD or Army who might be able to get us a copy?

Andrew,

I think your on to a looser as ther MOD have given us all they say they have - full EMER's

RACAL might be able to help more, BUT there is a snag there - they dont exist!!

I suspect that is where your enquiries end, except that there are so many spares around, by substitutuion you can find the problem module and replace it.

Good luck

Mike

Hi there As already said it is best to replace modules in the 351 id you can find the modules at a reasonable price.
These radios have flexible cmaterial used as inter-connects between the modules. If you have not already done so, you will see these flexible circuits when you extract the unit from the main case. Over time, these flexible circuits become really brittle and then they become the cause of lots of issues.
I recently picked up a 351+ antenna+ battery + handset with new inserts for £30 at a rally.. It is fully operational and if you deduct the market price of the ancillaries I got this radio cheaper than probably you would pay for a replacement module !
So my advice is to look for a cheap working unit at a rally.
Cheers

Hi,
I have 2 chargers both were originally for golf carts 24 volt
batteries they charge at 400 milliamps.....and when the voltage gets to 24v
the red light turns to green and the charging ceases .....will of course
do a lash up on the bench using 6x lithium iron 18650 cells.....the recent
ones i have removed from a laptop pc...
they weigh more than others i have removed from other devices.....
and a dead short test (naughty)...on my meter shows over 25 amps
any thoughts Leighton ??????

Hi JIm, I would presume the golf cart batteries are sealed lead-acid type?, Lithium batteries usally need their own type of charger to avoid over-charging, also they might not like being discharged below a certain voltege like LiPo cells. Be very carefull if you are using a different charger !.

Yes it was as you say for sealed lead acid batteries..... guess it would be difficult to find a Lithium Ion charger that would charge these in series....7x4=28 volts to individually charge them would be a pain of course
impossible if they are in the Clansman battery box....will have a look on ebay but doubtful if there is anything like that on there....
thanks

Hi

You're not far from the truth. I've a Clansman li-ion charger what uses standard Clansman charging socket but not batteries as currently new are mad expensive and none hit the surplus market as yet. The charger is 30v marked and li-ion specific but apparently ni-cad backwards compatible as it easily does my metal or plastic cased ones no problem.

Also own Imax B8+ charger what does any battery you name it up to 27 cells / 36 volts. Best purchase ever if it comes to the chargers.

hi,

I intent to build a Li-ion battery to be use with normal charger. I will use a lot os 18650 cells and a charger controller.

the charger controller avoid the cells do undercharger in use and overcharger in charger. is a PCB with a input/output wire in a side and connections to li-ion in other. I use a board smaller in vintage HTs that have not more NiCd cells.

ell, I not still assemble but I believe that works.

Dear All,
Do the GSA matching units fail?? is there a common mode and is
there a test other than no joy with the Radio! Leads check out Ok.
Thanks, I like to know it is US before tinkering.

An obvious test would be to check the SWR of the antenna . Set the appropriate sections of the anteena for the band of interest , for example in the case of 4 metres use three sections on a four section GSA. If mounted high and clear the SWR should read 1.2:1. Should be good on 6 metres too. If you have or can borrow an antenna analyser (I use an MFJ) the impedance should read 50 ohms.
If the result is bad either with an SWR or an antenna analyser then stick the GSA in the ground and measure the SWR. If it is still bad (say 2.5 : 1 or higher) then it is the antenna base or the wire connecting the antenna to the matching unitthat is most likely faulty. If it is ok then you have narrowed it down to the matching cable between the GSA and the matching unit.
BTW , I assume you are using the right length of matching cable. You need to use the one with thr right number of notches for the band of interest.
I hope this is helpful

Even simpler test! the most common failure is due to a serious mismatch the capacitor inside gets so hot the connections to it melt ! Just shake it if it rattles it is dead Adam g8umx

Now that is the kind of diagnostics I like ! Rattling it ! Thanks for this excellent tip. My GSA is up on top of a Clansman 5.4 metre mast. I have never looked to see if you can open these units to repair them. Probably best to hunt the usual sites for a replacement. PS I find rallies are always the cheapest place to buy Clansman bits. I have had some real bargains and good quality too !!!
Cheers
Stewart

It did rattle! the 2 screws holding inner assembly to base were loose.
Rest checks out OK except the inline capacitor shows 0.01 uF. Any idea
the value it should be?

Hi there, if this is the GSA Matching unit parts as follows - C1 is 30pf (rated 20v RMS at 76 Mhz) for mod strike 1 C1 is 22pf . R1 is 18ohms at 16 watts, C2 is 22pf (rated at 60v RMS at 76Mhz) from EMER L212 section 7. C1 and R1 are in parallel from input, to T1 then C2 is in output after T1. hope this helps. Leighton. GW3FSP.

1449. On Air Saturday 29th September, 2015

Yahoo group: Clansman351
Date: 2015-09-17 07:48:22 UTC
From: psgebbie@...
Topic: 1449 Message: 1449

Hi all
On Satutrday 19th September the weather is looking favourable so setting off to Sutton Bank in North Yorkshire, UK which is a high escarpment with commanding views. Having stopped off at Helmsley for the mandatory bacon butty, G0OII and I will be setting up on 2 metres SSB, 4 metres FM using a 352 and on 40 metres using a 320. We should be operating from 11am-4pm BST. Clansman frequencies are dial frequencies
Antennae will be relatively simple stuff. Ground plane on 40 metres, elevated halo on 2 metres and and an EK GSA for 4 metres.

Frequencies
Non Clansman 144.3MHZ USB
70.45MHz FM
7.1875MHz USB

For locals note that you can reach Sutton bank visitor centre from the east with no problem, however, the Sutton bank road itself is closed right now for crash barrier and road surface repair.
We hope to catch you on air. My callsign is G8YQN.
I am copying this post onto Clansman skeds too so that everyone gets to see it. So apologies to those folks also signed u p to the Clansman skeds group too.
Cheers
Stewart

Hi,

Anyone have a spare 351 module 11 (high band rx osc.). Reasonable price paid.

(PTS have the low band module for £4.50 + postage.)

Great, thanks Leighton. You don’t happen to have one of the long threaded pillars which holds the two halves of the set together next to the rf pass through? Someone has been in this set before me and reassembled it with all short ones.

No problem, I'll use a long machine screw with a couple of nuts locknutted onto it to set the length, on the assumption that there must be some reason for the long pillar in this position.

Is there any interest in the group in my writing up the restoration of 3 battered 351s with a few pictures? (Missing / broken fins repaired, paint touched up, new battery clips, couple of replacement modules, bit of tweaking.)

Hi.

Yes, absolutely! I would like to know how to split 351 prior to get it whacked by my ignorance.

My 351 has died on me with no rx - sounds like a strong carrier lifting squelch. I believe its something like a dry joint as it comes back briefly to normal operation when tapped around crystal filter so wanted to split the halves but gave upin the end.

it must have been a quite common fault as my mates 351 went down with same symptoms so if anyone got a same or similar faults - any comments appreciated.

With regards.

Arthur EI7GMB

Topic: 1453 Message: 1460

Just discovered a broken lug on one of the cases I had missed so I need to wait for the JB Weld to set so I can paint it then take the “after” photos”.

You may be in luck if the fault is on the rx side as it is a lot easier to access.

Following is all from memory – please let me know if anything is wrong with it.

Splitting a 351:

First remove the back panel by unscrewing the 4 captive allen headed bolts and pull off the connector. Remove any dessicant sachets.

Unscrew the 4 captive allen bolts on the front panel and slide off the centre sleeve. When you come to replace this, a reference for correct orientation is the “+ 24v –“ legend which should obviously go next to the battery terminals.

Now place the set on the bench with the rx side uppermost (modules 11, 12 etc. visible) and unscrew all the slotted pillars marked with a green ring.

Turn the set over and remove the pillar at the corner of the board nearest to the aerial sockets. Note that this pillar has a longer threaded portion than the others and must go back in this location.

Turn the set back over and you should now be able to hinge the rx section out, separating the miniature coax connection next to the long thread pillar. Note that with this coax disconnected the set will work but will not receive signals. (Could this be your problem? check this connection before dismantling.)

This is as far as you should have to go for a fault in the modules on this side.

Removing the tx section from the chassis to access the board is more complicated. First remove the 4 bolts holding the bnc connector and pull it clear of the front panel. Unsolder it. With a pair of fine nosed pliers pull the connection off the antenna base from inside. Pull off the red connector to the pin next to the fuse link between the front panel and module 10.

Remove 4 screws around the frequency switches and 4 round the power switch on the front panel. Remove all the remaining slotted pillars on the tx side. Note that there are two within module 18. Remove the 5 screws marked with green ring on module 16.

You should now be able to manoeuvre the whole assembly clear of the chassis. Remember that the front panel switches and their controls must be in the same positions when reassembling as they were when taken apart.

First thing with rx problems – is the problem common to both bands? If the fault is only below 48 Mhz it’s a low band fault, otherwise high band. If both it must be to do with sections common to both.

Hi.

Yes, absolutely! I would like to know how to split 351 prior to get it whacked by my ignorance.

My 351 has died on me with no rx - sounds like a strong carrier lifting squelch. I believe its something like a dry joint as it comes back briefly to normal operation when tapped around crystal filter so wanted to split the halves but gave upin the end.

it must have been a quite common fault as my mates 351 went down with same symptoms so if anyone got a same or similar faults - any comments appreciated.

With regards.

Arthur EI7GMB

1472. CHARGER/BATTS

Yahoo group: Clansman351
Date: 2016-01-16 15:32:50 UTC
From: tylee891@...
Topic: 1472 Message: 1472

Might have mentioned it before i always use the DC to DC 600 watt 10v to 80volt boost converter step up module supple.....generally i set it to output 30 volts at 2 amp charge rate but of course the current can be set much higher if needed fast charge.....charge all my Clansman batts with this excellent unit.EBAY FOR 10.00 POUNDS ..monitor battery temp with a infa red temp sensor .....so much better than the Clansman chargers.....

Frankly I don’t think there is anyone on 6 meters so you might as well help yourself, Jim .much more chance with 70.450. Quite busy in the Reading/Portsmouth area .VMARS use 51.7, but rarely and only at “meets” Take your 351(2) to a hilltop (Epsom Downs) on Sunday Morning 0900 and check out 70.325 when the weather gets warmer, Ted G3XUX sits on Butser Hill(Petersfield) and runs a net then. I have made it in to him from Brooklands!

Hi Folks,

Still alive.

I think we said use the VMARS frequency for 50Mhz. Have had a few QSOs on 4m now so that works a treat round here. I stuck a 3 ele yagi up 18 months ago, but haven’t done much with it since except test it and it goes about 80 miles under flat conditions.

Looking forward to the new season then I can tap the sticky relay and put it back in action.

REgards,

Stu – G4IYK

Topic: 1476 Message: 1476

How long are the "long" GSA elements?

I have a GSA with the "short" elements 5985-99-252-4532, but the 351/2 user handbook gives the number of elements to use vs. operating frequency I think for the long elements.

From: Denis Jakac
Topic: 1479 Message: 1485

Hello all,
I have just acquired a Racal VRM-5080 tank radio. I know the general talk here is 351's but I was wondering if any of you know about the power connection cable on the VRM-5080. There are two terminals. One colour of wire is blue, the other is red on the cable harness. I have used a multimeter and traced the red wire and found continuity at the fuse, therefore identifying the positive 24v connection. However, the blue wire does not show continuity to the radio case as a possible negative. Does this radio have a floating negative or is this another positive feed to the same connector? Is the radio chassis a negative? I wish I had a service manual for it. I would hate to smoke it as I just got it!
Cheers
Denis

Hello Denis I looked on the net and I saw photos of the set with all the cables connected, I think there is one on ebay UK The 24 volt power cable is shown plugged in to the set and there are the 2 cable ends ready for connection to the vehical supply. It would be red + and blue - for sure, same as the clansman vehicle harness IB2 Box It looks like the same cable connector. The hand set also looks clansman. I would say the 24V goes to a power supply unit on the set and then other voltages would be produced to run the radio. It a process of elimination. If red it plus then blue must be negative.

Thanks Alex. I tried that theory and nothing. I tried hooking up the blue to negative on 24vdc supply and nothing. If I check the blue wire to chassis there is no continuity. Most of the time the negative is grounded. In this case, I can't see the blue going anywhere unless I take the radio apart and I don't really want to do that in case it has a "self destruction" feature on it. LOL!
Cheers

From: Denis Jakac
Topic: 1479 Message: 1493

Hi Leighton,
I did read that and just tried it last night. The radio did power up! I'm wondering now what the blue wire is. Maybe it has to go to -24vdc as well. Strange arrangement. Maybe it does run internal circuits as well. Now I'm really confused as to why it would not "ring out" on the multimeter showing continuity between ground stud and blue wire.
? ? So now current setup to power it is red wire to +24vdc, ground stud to -24vdc, blue wire to??
Cheers
Denis

Hi Denis, good question, but I would suggest you connect it to the negative supply as it is I would think supposed to, the manual states there is a reverse protection circuit in there, also the positive from the power switch goes via various diodes and the on/off relay to the ground stud, so If I were you I would connect the blue to the neg supply. Leighton. GW3FSP.

I agree Leighton, I more or less said that. It may also be possible it doesnt work and has a power supply fault. I hope this is not the case. It wouldnt be the first time a so call GWO set ends up a DuD. Manual is next step I would say. Probably MARS group.

Hello Alex. Thanks for the input. I did get it to fire up by hooking -24vdc to the ground stud on the chassis. My only fear is that some milcom stuff had internal methods of self destruct. I had a hf jammer unit years back and it had two positions on the mode switch, test and operate. What I didn't know was that if you switched the mode switch to operate, once the jamming time, set by time dials, was up, the unit destroyed itself by sending over voltage to all the ic's!

? ? I will try, as I said, to hook up the blue wire to -24vdc, and see what happens. There are only two wires in the power cable so this would make sense. Interesting though that it powered up with the negative on the case, and not the blue wire. Maybe it requires both. I did not TX with the unit yet but will try maybe tomorrow.
Cheers
Denis

Hey thanks Alex. Postage from UK to Canada is very pricey as well. I paid half of the radio cost in postage! I just liked the set too much and offset the cost by selling off other unused equipment I had. It's currently 23:35 on Feb.14 here. I will try out the blue wire to negative in the morning. I'll post how it goes. Many thanks to all for the input and replies.
Cheers
Denis

Hello Robin,
Mine came from Army Radio Sales. I had quite a few issues with finding an outfit that would ship to Canada. Apparently, I found this out after I bought it, there is some law that states it is not to be sold outside of Europe! I guess I'm kind of lucky now. I actually asked TDM why they would not ship to Canada on one of their ebay auctions, and this is the reply they gave me:

Dear ve3zxn,

Hello
Unfortunately, the radio can only sell in European countries
These are the Regulation regarding the sale of these devices
Regards
Justyna Zając

Cheers
Denis

Hi all, I have unpacked this VRM 5080 kit, now I know why it weighs in at over 22Kg, in the box, one transceiver, one antennae base/tuner, several cables (power, harness,atu, and coax) two handsets, one for the set one for remote operation and two small satchels, I will connect up tomorrow and see what happens, apparantly I can connect the set to my spare TUAAM/antennae setup for the VRC 353 as the system is compatable, so far so good as they say, thanks to all who sent various PDF files to me, I think I have just about all the info I need now, but still no info on the internal PSU and how it connects to the outside world, I wonder why the set needs to have the chassis ground connected to the vehicle ground (negative supply) before it powers up, the info in the user instructions say it must as the power up relays need it, but why?. Leighton. GW3FSP.

Hi Leighton,

As I remember there is some emphasis in the Clansman vehicle installation manuals on the importance of fitting the various ground straps, perhaps the VRM kit was configured this way to make sure it happened?

Hello Leighton,
These were the same questions that I have. I currently have the power cable Red wire to +24vdc, and the blue wire to the chassis with the -24vdc, and it is working. I just want to make sure it is correct. Does your power cable have the exposed red/blue wires, or is it provided with a connector on both ends??
? ? My kit was just the radio itself. I wanted all the bits but as I stated before, no one would ship to Canada. Army Radio was selling only the radio with no ancillaries. Let me know how it powers up, if all is well.
Cheers
Denis

?

Hi all, I have unpacked this VRM 5080 kit, now I know why it weighs in at over 22Kg, in the box, one transceiver, one antennae base/tuner, several cables (power, harness,atu, and coax) two handsets, one for the set one for remote operation and two small satchels, I will connect up tomorrow and see what happens, apparantly I can connect the set to my spare TUAAM/antennae setup for the VRC 353 as the system is compatable, so far so good as they say, thanks to all who sent various PDF files to me, I think I have just about all the info I need now, but still no info on the internal PSU and how it connects to the outside world, I wonder why the set needs to have the chassis ground connected to the vehicle ground (negative supply) before it powers up, the info in the user instructions say it must as the power up relays need it, but why?.

Hi Denis, the power lead I have has the 2 pin socket one end and a pair of terminal lugs the other, these cables are both black however,Curiouser and curiouser !, I will be assembling this set tomorrow with my spare 353 TUAAM and whip on it for a play, will let you know what happens. Hi Niall, I have been pondering that, I have seen that instruction in some of the manuals I have seen for the vehicle installations, and from friends who used the Clansman kit whilst serving in the Forces, strange thing is, the set has a Larkspur type power connector, and can use the 353 antennae system with no problem (the TUAAM etc) I am wondering if, when the power is supplied via the positive of the power connector and the ground strap the relay system in the set then enables the negative connection of the power input socket to the set completing the supply conections, only way to check that would be to get hold of the diagrams of the power supply and the input switching, or, try and measure the resistance between the chassis and negative supply cable when power is applied, or the voltege difference between them with power off and on. Hum !. Looks as though I have some experimenting to do when I get this set up and running, which might be tomorrow.

Ok Leighton. What I did was do continuity checks from the exposed wire ends on the cable to the connector, then I checked which terminal was positive by going to the fuse access on the front panel. This wound up being the red wire for me. I then just put -24vdc to the remaining blue wire, and the ground stud on the front panel.

Hi Folks, It works !, fitted a Clansman 2 pin connector on the feed end of the cable I had with the set to connect it to my Clansman power distribution box (3 output box) I checked the power connections to the set and found the negative input was connected to the chassis, so no problem there, using a power meter as a load I connected the set and switched on, pressed the clear button, and away it went, programmed 70.450 into channel zero and tested the set with my 353 and loud and clear both ways, maximum power out is 58W on high power, set to medium I am getting 10 W, just printed out the operating manual to have a read, will try programming the other channels after digesting the tuning procedure, strange figures in the other channels however, I will note those and put them in my files folder. So far so good !. Leighton. GW3FSP.

Way to go Leighton! Now I'll have to work on that super long yagi and point northeast! Wonder if the 50 watts will do it! Do you folks monitor the 6m band? If you do, what is the SSB frequency that is generally used your way? I'll have a decent 6m setup by this coming summer.
Cheers
Denis

Hi Jim, particularly when used as part of a re-bro station is is better to have pre-set squelch because signal /signal +noise is better than an absolute value.If the squelch is set too hard the rebro range will be dramatically reduced.(As is true of any set with adjustable squelch)It is also one less control to fiddle with and cannot be adjusted by accident.I have worked on sets over the years with no squelch adjustable and pre-set squelch and of the three I prefer pre-set as it removes another uncertainty as to whether the set is o.k. or not.

Hello group. I dont get to do as ofter a I would like but yesterday was a particularly memorable DX session carried out in conjunction with another VK station on the east coast of NSW VK2BSY
VK2BSY set up in his favorite DX position on the rocks overlooking the Tasman Sea. About 10Km to the south I set up my Clansman 320 inches from the shore of a large salt water lake, we were both set up with 1/4 verticals. Over the course of the afternoon we were able play tag team giving each other a rest while managing our European pile up. The DX session spanned about 2 &1/2 hours with pages of contacts recorded. Many of these contacts were into the UK and countries in western Europe. All this was done on the 20M band. The pleasing thing was we were both receiving similar signal reports from stations contacted. Many stations were delighted to have contact not only one portable station in VK but 2. A very enjoyable session.
To top things off I was email this morning by one of our contacts Aldo who also has a great interest in the 320 and sent me a link of his contact with another 320 see below.

Alex VK2HAS

Hello Alex, thanks for the QSO in 20 mt. I am also a fan of military surplus and even I possess 2 PRC 320. Very beautiful stations (I have the original English version and the one built in Yugoslavia in the 80's). I send you a limk YOUTUBE a QSO with my friend IZ2ODT with 2 PRC 320 in Italy. Hi

No probs, it is onteresting :)

I was wondering how an VK station(s) got an PRC320 over there? It must have been more on the postage fees than the PRC320 is worth on its own?

Hi

Once upon the time we had an conversation with a friend of mine about the Falklands. As he concluded - there must be tons of Clansman radios left to rot out there as the British wouldn't be too pushed about bringing it back for various reasons (say - the transportation of the troops & all the gear was quite an logistic issue, not to mention the costs of the operation alone). So the question arises - how true could it be? And if so - would any MOD-like shops have Clansman line on sale now? Maybe it would be a bit cheaper then for VK's as it would be als much closer than the UK? Probably not, but just a food for thought.

Or maybe Clansmans are still in the service?

Hi

No probs, it is onteresting :)

I was wondering how an VK station(s) got an PRC320 over there? It must have been more on the postage fees than the PRC320 is worth on its own?

Hello group. I dont get to do as ofter a I would like but yesterday was a particularly memorable DX session carried out in conjunction with another VK station on the east coast

of NSW VK2BSY
VK2BSY set up in his favorite DX position on the rocks overlooking the Tasman Sea. About 10Km to the south I set up my Clansman 320 inches from the shore of a large salt water lake, we were both set up with 1/4 verticals. Over the course of the afternoon we were able play tag team giving each other a rest while managing our European pile up. The DX session spanned about 2 &1/2 hours with pages of contacts recorded. Many of these contacts were into the UK and countries in western Europe. All this was done on the 20M band. The pleasing thing was we were both receiving similar signal reports from stations contacted. Many stations were delighted to have contact not only one portable station in VK but 2. A very enjoyable session.
To top things off I was email this morning by one of our contacts Aldo who also has a great interest in the 320 and sent me a link of his contact with another 320 see below.

I think they would have brought it back – it was still brand new at the time, units were equipped with Clansman for the first time specifically for the conflict, and a lot of it was lost when the Atlantic Conveyor was sunk, so there was a shortage.

Incidentally, the Argentinian forces had Clansman too.

Did the Australian forces not have it? If not, what did they have instead?

Hi

Our thinking was that some stand-by regiments might have been left with all the gear waiting "just-in-case" and the gear bu the size and weight - left out there as costwise probably it would be same or cheaper to manufacture a new set than haul it forth and back?

But you could be right, a military way to be is not to save the taxpayer's money, yet a thought of an "clansman's graveyard" makes my imagination running...

Interesting, because they did use Larkspur, or a subset of it, when it was current. I have a pdf of an Australian forces document on “B” vehicle harness from 1960 which turned up when I was looking for something else which is all Larkspur.

Hi.

I am led to believe that the Australian Army uses Barrett 2090/2050 radios?

I can confidently say that the SADF never used the clansman radio system. Maybe Larkspur at some very very early date, but the primary HF radios from in use by the SADF during the 70's and 80's were their version of the Thomspon CSF TRC-300/4 which was known as the B25, their version of the Racal Syncal30 known as the TR48 (and improved with frequency hopping that was later copied by Racal UK), and then The C21 in the late 80's- early 90's and the Grintek TR178 in the late 90's. Never anything from the clansman line.

Hi

Thanks for this info, that makes it all different. Well, will have to share the news with friends and I say they could be equally disappointed as myself. But yet it would open another possibilities to "dream about Racal Atlantis" ha ha. Obviously Clansmans aren't the only green radio in my collection, so that info is greatly appreciated.

Hi Artur,

To my knowledge the Clansman system really wasn't all that widely used outside of the UK. I know the Yugoslav army used the Plessy PRC320L for HF, but not the VHF manpack sets. I think Spain used the Racal PRC349, but not sure on other radios.

Hi

While I am not surprised to hear that in quite a few African countries Clansman family radios were in use, then it really baffles me how it has happened that former Yugoslavian army got PRC320L into the service? Did it happen while they were still behing the Iron Curtain times? I thought that Warsaw Pact countries and communist regime countries in general were all sharing RBM / R and the like series radios with few minor changes (ie localised decals, or adapted enclosures). I remember that Tito fell foul with Stalin and Yugoslavia gained a much independend course ever since, yet selling high tech to politically "uncertain" country in my opinion would be quite risky.

Hi

There never was one!

Two short equal 1 long.

Mind you knowing something about antenna theory you might be able to slightly improve on that!

Hi,

Info plate on base should have the following info added when the reducer for the short rods is fitted to the rod mounting. Mod. plate should have “2” struck.

MHz No. of rods.
30 – 53 8
52 – 71 6
70 – 76 4

Hi Martin, this info from the mod sheet L217 mod 14.

The length should be

30-53MHz = 8 short elements (4 long)
53-70MHz = 6 short elements (3 long)
70-76MHz = 4 short elements (2 long)

Leighton. GW3FSP.

Im hoping to try it out 'in anger' on sunday during my lunchbreak up here at Emley, when my hiking partner is up on the Yorkshire 3 peaks!

1549. Using the 1.2m whip folded

Yahoo group: Clansman351
Date: 2016-04-09 21:02:23 UTC
From: barfield673@...
Topic: 1549 Message: 1549

Hi All,

I have chance to use my PRC-352 (as it is now) in 'anger' tomorrow, around lunchtime, on 6m and 4m,

The 1.2m whip is four sections. It makes sense to me that, in the absence of an ATU, folding the antenna may allow it to be more efficient on the higher frequencies, assuming that the radio is optimised for this antenna at the lower frequencies. But the manuals seem not to mention if this is the case.

Has anyone any experience of this?

1.2m is 'about' a quarter wave on 4m, but if the radio is optimised for this antenna across the board it might work better here if shortened. If no such optimisation exists then it would be badly short for a 30MHz antenna!

At some point I want to 'touch up' the paint on my 352 set-up and my 320.

The paint for these sets seems pretty expensive, and comes in various sizes. But, I dont know how much im likley to need!

Lets say I get a 400ml spray can, could I reasonably expect a single can to be enough to give a 352 (351, 20w amp, plus GS frame) a decent revamp?

Hi Martin, the 2 part paint is the equivilent of the original, it needs the metal to be cleaned and primed before applying (if you are going to re-paint that is) otherwise the spray paint will give the same colour as the original, just rub down anywhere the paint has been chipped off smooth, makes the set look brilliant in the correct colour. Leighton. GW3FSP.

1562. PRC-351 frequency switch alignment

Yahoo group: Clansman351
Date: 2016-05-25 11:37:33 UTC
From: barfield673@...
Topic: 1562 Message: 1562

Hi All,

I have a small problem! Having dismantled my 351 for refurbishment, I forgot to make note of the frequency switch positions and the frequency knob positions. Now, coming to rebuild, I find that I have no idea what frequency it was set to, and thinking the easiest thing would be simply to move the switches up to their endstops, I did so, only to find they have no end stops! (these I discovered are part of the die cast case!)

I need a way to align the knobs and switches. I note that it is possible to identify and set a position on the switches where the detent spring is visible and align that say towards the bottom. Can anyone advise what value that would give in that position so that I can then align the knobs to it?

Otherwise it will need a lot of potentially damaging trial and error, and as ive just added the 10m mod as well its a bit more complex!

Regards
Martin

Why would you not just try to fasten the grub screw aiming at already marked surface and then maybe give it a fine alignment if it would stay off the window too much?

If that's not the option for whatever reason then just dial a frequency where access to the grub screw is best and then using frequency counter set corresponding frequency on prc351 and you're sorted.

It has to be something easy to do.

1564. Re: [Clansman351] PRC-351 frequency switch alignment

Yahoo group: Clansman351
Date: 2016-05-25 20:59:14 UTC
From: barfield673@...
Topic: 1562 Message: 1564

There are no grub screws

The control knobs are held by circlips on the inside of the casing, and are free to rotate within limits set by the casting. The switches have no end stops to set them against so just rotate around and around.

After quite some work investigating I discovered that the switches have very faint dots molded on them. From the synthesiser truth table I worked out that on the 1MHz, 100kHz and 25kHz controls, when these dots are aligned its the zero setting, so setting the corresponding knob to zero allows them to line up when the set is reassembled. The 10MHz knob is different, when the dots are aligned on that switch its set to 3, so the 10MHz knob has to be set to 3 to align. These are all when the switches control slot is horizontal, so with the dots aligned and 30.000 set on the knobs the set reassembles properly.

Not at all easy, and no mention of it in the manuals as far as I can find

1565. ETHANOL in unleaded petrol damages OLD VEHICLES

Yahoo group: Clansman351
Date: 2016-06-03 07:35:38 UTC
From: MB
Topic: 1565 Message: 1565

I expect your fully aware of the increased ETHANOL content in unleaded petrol and the effect this has on seals and some metals in the fuel system, carbs can also get gummed up.

The Historic Vehicles federation recommends an additive, and one such is

FROST ETHOMIX which comes in small containers sufficient for 250 Ltrs of fuel, added at the point of fill-up.

Another expense I know, but it seems likely to save an even greater expense later.

To reduce the cost I have purchased a full box of bottles and am now selling the surplus at cost price to me. Collect from Croydon, delivered to the War and Peace show nr Folkestone, Military Odyssey, nr Maidstone or Flight Refuelling Radio Rally nr Wimborne Minster in August, or elsewhere by agreement.

By post direct from Supplier about £18 including postage

IF YOU COLLECT FROM ME, CASH IN HAND, £10 EACH

Oh, this problem is nothing to do with the earlier problem of unleaded when 4* became non-available.

Mike

1570. PRC-350 modulation fault

Yahoo group: Clansman351
Date: 2016-06-21 21:43:46 UTC
From: barfield673@...
Topic: 1570 Message: 1570

Hi All,

Im wondering if anyone has seen this fault before and can advise,

I have a PRC-350 with a modulation fault. Tx output power is good, 150Hz sub-tone is present if a little low (900Hz dev.) but voice modulation is very very poor, in fact hardly noticable, even on 'scope of my Marconi 2955. If I whistle it up really hard I get occasional momentary bursts at full deviation, but they are very short and infrequent.

Receive has no issues at all, and is very sensitive. Its just the voice modulation thats amiss. Im currently suspecting module 12 or 13 (Tx audio module and Tx modulator). Im hoping it will be something as daft as a sticky pot

Any suggestions would be appreciated

Regards
Martin G7MRV

I just got one of these sets. It works with +24V to the red wire and 0v to the blue but there is one oddity - it will not work on high power when connected to a PSU. I have tried a switch mode and a linear psu and the result is the same - works on low and med power, on high power into a dummy load via a power meter the needle flicks up to about 60W then immediately falls back to nothing, subsequent PTT operation produces nothing. If connected to a Clansman 4Ah NiCad or pair of gel cells its fine, although it sometimes flicks around the 60W mark a few times before settling down. I tried floating the gel cells across the linear PSU, it works as long as the PSU is off, as soon as it is switched on, same issue. I have tried connecting the earth terminal to the -ve terminal of the psu, no difference. Anyone had similar issues?

Also does anyone know if the harness connector is compatible with Clansman harness?

Not sure but I can't see any reason for this happening. Maybe some RF is messing up your power supply or SWR sensing on the set causing rf power cut back?

No, it's just a generic 12vdc to 24vdc voltage doubler I bought on ebay. I believe it is one of those Chinese types that is potted, with a heat sink, all sealed, and four wires coming out, two for input, and two for output.
Cheers

The idea of two 12vdc car batteries, or a couple of good sealed lead/acid batteries is probably the best way to go. There are no worries of any electronics going out of regulation and smoking the radio. I'm taking my chances with the DC to DC converter I'm using. I may be going the battery route myself, just to be sure. Having to fix one of these radios due to over voltage or something of that nature would not be fun.

I just got one of these sets. It works with +24V to the red wire and 0v to the blue but there is one oddity - it will not work on high power when connected to a PSU. I have tried a switch mode and a linear psu and the result is the same - works on low and med power, on high power into a dummy load via a power meter the needle flicks up to about 60W then immediately falls back to nothing, subsequent PTT operation produces nothing. If connected to a Clansman 4Ah NiCad or pair of gel cells its fine, although it sometimes flicks around the 60W mark a few times before settling down. I tried floating the gel cells across the linear PSU, it works as long as the PSU is off, as soon as it is switched on, same issue.

I have tried connecting the earth terminal to the -ve terminal of the psu, no difference.

Anyone had similar issues?

?

Also does anyone know if the harness connector is compatible with Clansman harness?

Thanks. The linear supply should be more than capable, and the voltage seems to be rock solid all the time. It is homebrew (based on the design in the ARRL handbook) and a work in progress though, so I will investigate along those lines. I noticed there are changes to the design in a later edition which might be related. Maybe a transient current limiting issue.

Not sure but I can't see any reason for this happening. Maybe some RF is messing up your power supply or SWR sensing on the set causing rf power cut back?

Subject: [Clansman351] VRM5080

I just got one of these sets. It works with +24V to the red wire and 0v to the blue but there is one oddity - it will not work on high power when connected to a PSU. I have tried a switch mode and a linear psu and the result is the same - works on low and med power, on high power into a dummy load via a power meter the needle flicks up to about 60W then immediately falls back to nothing, subsequent PTT operation produces nothing. If connected to a Clansman 4Ah NiCad or pair of gel cells its fine, although it sometimes flicks around the 60W mark a few times before settling down. I tried floating the gel cells across the linear PSU, it works as long as the PSU is off, as soon as it is switched on, same issue. I have tried connecting the earth terminal to the -ve terminal of the psu, no difference. Anyone had similar issues?

Also does anyone know if the harness connector is compatible with Clansman harness?

I agree with you on the marginal issue. The unit does work, and for the most part, I'm on medium power setting on the VRM5080. I like the battery idea a lot and I have the sealed lead acid batteries for it. I'm just going to look for a 24vdc charger and only have the charger on, when the radio is off. My power supply on the 12vdc side is a rack mount, 48 amp, Lambda commercial supply.

I tried the name of the device in your link as a search on UK ebay and found some higher power ones. The price does rise steeply with power capacity. It also raises the issue of the 12 V supply for it, my bench supply won’t cope. So, battery plus converter or 2 batteries, price probably about the same.

Hello Alex,
?; ? ? ?Thanks for the info. I have not noticed any added noise on my VRM5080 when using the DC to DC converter, but I have no real way to measure for sure other than listening to the radio itself. I wanted to put the radio in my vehicle, but with the 25khz spacing, I miss a few repeaters that we have here. This is one of the reasons my six meter repeater is no tone, and 53.450mhz, with a 1 mhz negative offset so that military radio users can work a repeater. I am using the Vertex VX-4000L commercial radio converted to six meters in my vehicle. You never know though, I may one day mount the VRM5080 in its place. I have two of them. The "cool" factor is plenty worth it! Lol
Cheers

Yes, the price I would imagine would rise quite a bit. I would agree with the battery layout. As you stated, the costs would be the same. Plus the safety factor of using the batteries over trusting the electronics. Not to mention, as Alex stated, the possibility of noise generation in the radio.
? ? ? If a battery fails, it will usually short a cell, or fail open, and in both cases, there is no worry of an over-volt condition. This is my biggest worry of these dc-dc converters, especially the less expensive Chinese versions. I have seen many "quality" power supplies fail in regulation and the voltage shoots right up. I have seen 13.8vdc supplies that have failed in this manner and had an output of 26vdc!

The bit of my linear psu which is still to be added is an overvoltage crowbar for just this reason! I’m going to alter the regulator circuitry to the version in the later handbook and possibly tweak the current foldback. The transformer in mine is bigger and there are more series pass transistors. (It’s based on an existing supply which had a dead reg. board and no info. available.)

I’m considering a mobile installation much along military lines with a couple of batteries in the back of the pickup and a charging circuit.

Subject: Re: [Clansman351] VRM5080

The bit of my linear psu which is still to be added is an overvoltage crowbar for just this reason! I’m going to alter the regulator circuitry to the version in the later handbook and possibly tweak the current foldback. The transformer in mine is bigger and there are more series pass transistors. (It’s based on an existing supply which had a dead reg. board and no info. available.)

I’m considering a mobile installation much along military lines with a couple of batteries in the back of the pickup and a charging circuit.

Yes, the price I would imagine would rise quite a bit. I would agree with the battery layout. As you stated, the costs would be the same. Plus the safety factor of using the batteries over trusting the electronics. Not to mention, as Alex stated, the possibility of noise generation in the radio.

If a battery fails, it will usually short a cell, or fail open, and in both cases, there is no worry of an over-volt condition. This is my biggest worry of these dc-dc converters, especially the less expensive Chinese versions. I have seen many "quality" power supplies fail in regulation and the voltage shoots right up. I have seen 13.8vdc supplies that have failed in this manner and had an output of 26vdc!

Cheers

I tried the name of the device in your link as a search on UK ebay and found some higher power ones. The price does rise steeply with power capacity. It also raises the issue of the 12 V supply for it, my bench supply won’t cope. So, battery plus converter or 2 batteries, price probably about the same.

I agree with you on the marginal issue. The unit does work, and for the most part, I'm on medium power setting on the VRM5080. I like the battery idea a lot and I have the sealed lead acid batteries for it. I'm just going to look for a 24vdc charger and only have the charger on, when the radio is off. My power supply on the 12vdc side is a rack mount, 48 amp, Lambda commercial supply.

From: Alexander
Topic: 1479 Message: 1593

Some time ago I purchased an adjustable up converter 12 to 24+ I mounted it in a ventilated box and it plugs into my cigeret lighter in my car I have it set for about 27.5V (I forget) and I use it to charge my 24V clansman battery when Im out and need a charge. you could make one of these and have it charge 2 small 12V batteries in series mounted in your vehicle, and only have it charge when the car is running and the radio is off. That way always charged batteries, no noise and no chance of over voltage.

Pretty much the lines I'm thinking along, with the addition of an automatic split charge relay I happen to already have which switches on when the engine is running and the alternator is charging. Robin's unit looks like the ultimate answer, but pricey!

Hi All New Member Here,

I have just purchased a pair of PRC 351 and need to reset the squelch for receiving non-clansman transmissions. I have looked back at the forum and found this:-

If I remember correctly you can adjust the squelch level to all but remove the requirement for the 150Hz tone to be received to trip the squelch, you need to adjust R2 module 11 (Hi band) R2 module 12 (Low band) R2 module 9 either band, with no signal being received adjust (say) R2 module 9 'till the squelch lifts, then slowly twiddle R2 'till the set squelch operates, the set should then 'unsquelch' with low level carriers that do not have the 150Hz tone present

What confuses me is the reference to 3 squelch pots, I understand the separate ones for high/low band RX but confused about R2 module 9 ? can someone please explain the relationship between the 3 squelch pots regards

Hello Alan, I reciently spoke to a friend via a 6 meter repeater and
later using simplex using my 351, he was using a comercial transceiver,
we had no trouble?

The module 11 and 12 presets set the injection level of the internal 160 Hz tone which enables the squelch in the absence of a 150 Hz carrier tone (the 10 Hz difference is to avoid audible “beating” effects when the carrier tone is present). The module 9 preset sets the overall squelch sensitivity.

All 351 I had were operating on carrier squelch and no 150hz was ever needed. IF it was not opening on carrier but would do when 150hz tone was present it was obvious sign of squelch circuit being faulty or misaligned. Two different squelch adjustments were relevant to two operating ranges of low and high channels. 3rd pot mentioned was to set deviation of 150hz what is too heavy to listen to and unnecessary for amateur radio but rest was module 13 and pot 9 affair? Unless someone was on about oscillator part of sql.
Either way 160hz oscillator in sql circuit is crucial for carrier squelch being operational without a need for 150hz.

Are you sure its the receive squelch you need to adjust? The way the clansman tone squelch works, you shouldnt need a tone on receive from another radio type (say a typical ham radio) to open the squelch, as the necessary 160Hz tone is internally generated.

What is frequently the issue however is that the 150Hz tone on Transmit from the Clansman, being of rather high deviation, causes annoyance to non-clansman radio users. And it is this Tx tone that is usually turned down or removed.

Are you thinking to do this adjustment because its something you've been told is needed, or have you tested them and found that the squelch is actually behaving incorrectly on receive on the clansman sets?

If you have suitable test gear that can measure the Tx tone deviation you can easily turn it down to a level that will still activate the squelch on Clansman sets requiring the tone (such as the 349) but is less annoying to other radio hams, but if not its easiest to turn that right down.

As for the 160Hz tones for the clansman receiver, adjusting those is really best done with a suitable signal generator!

Cheers
Martin

I set the tx tone on my 351s “by the book” using a deviation meter and a pressel without headset plugged in. I don’t understand why there are ham rigs around which pass frequencies as low as 150 Hz to the speaker anyway; it’s not helpful for communication.

Not sure as to whom two of the above posts were exactly directed as no thread follow up here is seen but what I came across is:

By the standard Clansmans were of 25khz spacing with about 6khz deviation and 150hz was likewise higher.

Few 351's here I found being set at 10khz deviation and one even at 11khz and it did not look as it was a coincidence or age related misalignment.

150hz tone is apparent on headphones on "ham" gear and also on ex pmr with large speaker as old pye/philips ones - my favorite for nice audio reproduction. Rigs like Ascom 550 are certainly able to pass 150hz easily and it is well audible thus people prefer to have it off (did not bother me too much, but no point in transmitting it to upset others). Turning down 150hz does not affect radio squelch at all (tested, proven true).

with regards

Hi All,

Thanks for replies so far.

As the original post, I have the Icom 7300 which can generate 4M but I dont know what the deviation setting on the Icom is ? I guess being a new rig its going to be narrow deviation, Neither of the 351 will receive it. The 7300 does hear the hum, so i will turn the tome down/off on both Clansman.

Then working clansman to clansman one works OK on *WL but the other only RX on *.

I think the first priority is getting to RX on the Amateur Rigs as there are more of those in the area than clansman.

Will try to have a play tomorrow .

Regards

Alan

I presume Icom would be 5khz at 6m by standard and 2.5khz if narrow fm is picked. at standard 5khz it should cooperate with 351 no problem.

Clansman to clansman MUST HAVE worked with squelch on at all times. If one works with * position only then definitely it's a squelch circuit faulty on this very radio.

Two easy tests for 351 with your Icom.

Deviation - if 351 sounds exceptionally loud, distorted or even blocking the rx - deviation is too wide and needs to be aligned.

Try two-three different ctcss tones close to 150hz - if it would open the squelch on otherwise "deaf" radio, then your squelch circuit oscillator is off the frequency.

Hi all,

Making some progress on one of the rigs.

Adjusted the settings of R2 on Module 9/11/12 -No difference.

In the end found that adjusting the 160/150 tone freq on R4 on Module 13 solved the problem

Is there an easy way to get to a test point (without splitting the PCB into two halves to measure the tone freq.) and what is the correct method to set R2 on Module 9/11/12 ?

I do have access to the manuals via VMARS, but the only one I have download so far gives the Circuit Diagram, Technical Description and parts list but no test or alignment information.

Just to update this, it seems to be a problem with the power meter I was using. It is fine with any other meter I have tried. I wondered about the lack of error messages on the radio display when it happened, suspect there was no problem with the power output, just a duff meter. Never put that much power through the meter before.

Thanks. The linear supply should be more than capable, and the voltage seems to be rock solid all the time. It is homebrew (based on the design in the ARRL handbook) and a work in progress though, so I will investigate along those lines. I noticed there are changes to the design in a later edition which might be related. Maybe a transient current limiting issue.

Not sure but I can't see any reason for this happening. Maybe some RF is messing up your power supply or SWR sensing on the set causing rf power cut back?

I just got one of these sets. It works with +24V to the red wire and 0v to the blue but there is one oddity - it will not work on high power when connected to a PSU. I have tried a switch mode and a linear psu and the result is the same - works on low and med power, on high power into a dummy load via a power meter the needle flicks up to about 60W then immediately falls back to nothing, subsequent PTT operation produces nothing. If connected to a Clansman 4Ah NiCad or pair of gel cells its fine, although it sometimes flicks around the 60W mark a few times before settling down. I tried floating the gel cells across the linear PSU, it works as long as the PSU is off, as soon as it is switched on, same issue. I have tried connecting the earth terminal to the -ve terminal of the psu, no difference. Anyone had similar issues?

Also does anyone know if the harness connector is compatible with Clansman harness?

Hello Niall,
? Six meters is an interesting band. I had a vswr/power meter that when I was testing for vswr, if I moved the meter around, my vswr would change! I find when running a bit of power on this band, it gets into everything! Years ago, I was running about 400 watts on six, and would be able to light up equipment on my bench that was turned off! I had my equipment grounded and everything. I am currently experiencing an issue while trying to set up a mobile antenna for six. If I run a magnet mount, vswr is low, if I use a fixed mount on a hole in the center of my roof, vswr is high! Very strange. Installing 50ohm load on end of the feedline shows excellent vswr! I'm really scratching my head on this one!
Cheers

?

Just to update this, it seems to be a problem with the power meter I was using. It is fine with any other meter I have tried. I wondered about the lack of error messages on the radio display when it happened, suspect there was no problem with the power output, just a duff meter. Never put that much power through the meter before.

I just got one of these sets. It works with +24V to the red wire and 0v to the blue but there is one oddity - it will not work on high power when connected to a PSU. I have tried a switch mode and a linear psu and the result is the same - works on low and med power, on high power into a dummy load via a power meter the needle flicks up to about 60W then immediately falls back to nothing, subsequent PTT operation produces nothing. If connected to a Clansman 4Ah NiCad or pair of gel cells its fine, although it sometimes flicks around the 60W mark a few times before settling down. I tried floating the gel cells across the linear PSU, it works as long as the PSU is off, as soon as it is switched on, same issue.

I have tried connecting the earth terminal to the -ve terminal of the psu, no difference.

Anyone had similar issues?

?

Also does anyone know if the harness connector is compatible with Clansman harness?

Hi Denis,

This may well be complete rubbish, but could the vehicle bodywork be half wave resonant at 50 Mhz giving a high impedance at the feedpoint, and the capacitance of the magmount is tuning it out? Or like my issue it could be a meter problem, possibly caused by an earth loop. Maybe try a different length of coax, or a choke balun? Run the rig from a separate battery to eliminate the possibility of an earth loop?

In a similar way maybe the interference problems are due to the fact that lots of power and signal cables are around 1.5 M long.

Hi Niall,
? ? ?That may not be complete rubbish at all! I have never had an issue tuning a 50mhz system before on any vehicle. You may be correct about the magnet mount capacitance creating a tune. One thing I noticed was if I touch the vswr meter, or move it around, the vswr changes, by quite an appreciable amount. I am trying to match a Larsen base loaded quarter wave. It is their model NMO50.
I have a NMO mount fed through the metal roof permanently. When mounted in this fashion, vswr is high, when using mag mount with the same antenna, vswr is low.
? ? ?My vehicle is a 2013 Ford AWD Explorer. I guess ill have to measure the roof length and see if that's an issue. I noticed that Comet makes a 6m antenna called an HFB-6, and its only available in Europe, not in North America, strange. I hear it's performance is good. I have a huge 3m military tunable fiberglass whip for 6m but am trying to avoid having to go that route.
Cheers
Denis

Hey Jim,
? I kind of wish we had the 4m band here across the pond. I have a radio for it, but it is not a legal band in Canada.
Cheers

Hello Niall,
? Six meters is an interesting band. I had a vswr/power meter that when I was testing for vswr, if I moved the meter around, my vswr would change! I find when running a bit of power on this band, it gets into everything! Years ago, I was running about 400 watts on six, and would be able to light up equipment on my bench that was turned off! I had my equipment grounded and everything. I am currently experiencing an issue while trying to set up a mobile antenna for six. If I run a magnet mount, vswr is low, if I use a fixed mount on a hole in the center of my roof, vswr is high! Very strange. Installing 50ohm load on end of the feedline shows excellent vswr! I'm really scratching my head on this one!

Just to update this, it seems to be a problem with the power meter I was using. It is fine with any other meter I have tried. I wondered about the lack of error messages on the radio display when it happened, suspect there was no problem with the power output, just a duff meter. Never put that much power through the meter before.

Thanks. The linear supply should be more than capable, and the voltage seems to be rock solid all the time. It is homebrew (based on the design in the ARRL handbook) and a work in progress though, so I will investigate along those lines. I noticed there are changes to the design in a later edition which might be related. Maybe a transient current limiting issue.

I just got one of these sets. It works with +24V to the red wire and 0v to the blue but there is one oddity - it will not work on high power when connected to a PSU. I have tried a switch mode and a linear psu and the result is the same - works on low and med power, on high power into a dummy load via a power meter the needle flicks up to about 60W then immediately falls back to nothing, subsequent PTT operation produces nothing. If connected to a Clansman 4Ah NiCad or pair of gel cells its fine, although it sometimes flicks around the 60W mark a few times before settling down. I tried floating the gel cells across the linear PSU, it works as long as the PSU is off, as soon as it is switched on, same issue.

I have tried connecting the earth terminal to the -ve terminal of the psu, no difference.

Anyone had similar issues?

?

Also does anyone know if the harness connector is compatible with Clansman harness?

Sounds like there is RF on the coax outer. What happens if you form a choke near the antenna base, by coiling about 5 turns of the coax round a 1” former?

Hi Niall, That may not be complete rubbish at all! I have never had an issue tuning a 50mhz system before on any vehicle. You may be correct about the magnet mount capacitance creating a tune. One thing I noticed was if I touch the vswr meter, or move it around, the vswr changes, by quite an appreciable amount. I am trying to match a Larsen base loaded quarter wave. It is their model NMO50.I have a NMO mount fed through the metal roof permanently. When mounted in this fashion, vswr is high, when using mag mount with the same antenna, vswr is low. My vehicle is a 2013 Ford AWD Explorer. I guess ill have to measure the roof length and see if that's an issue. I noticed that Comet makes a 6m antenna called an HFB-6, and its only available in Europe, not in North America, strange. I hear it's performance is good. I have a huge 3m military tunable fiberglass whip for 6m but am trying to avoid having to go that route.CheersDenis

Hi Denis,

This may well be complete rubbish, but could the vehicle bodywork be half wave resonant at 50 Mhz giving a high impedance at the feedpoint, and the capacitance of the magmount is tuning it out? Or like my issue it could be a meter problem, possibly caused by an earth loop. Maybe try a different length of coax, or a choke balun? Run the rig from a separate battery to eliminate the possibility of an earth loop?

In a similar way maybe the interference problems are due to the fact that lots of power and signal cables are around 1.5 M long.

From: asgv30@...
Topic: 1617 Message: 1617

Two of my ever growing collection of 351s have an identical fault: no TX sidetone in L or W. Sidetone is present in * and there is power out in all positions.
If left switched on for a while, the sidetone starts to work.
Before I start measuring control voltages around the squelch module, anyone had this problem and solved it?
I have ruled out the remote board by substitution of the complete end assembly.

I will shortly be getting the transformer unit for one of these. I have the value for the terminating resistor and the length of the radiating element but what I can't work out from the available information is, is the counterpoise the same length as the radiator or is it the right length to join the earth connections of the transformer and the resistor i.e. the base of the triangle? One source says the two wires are "identical".

Thanks Leighton,

Interestingly I found a few descriptions of a “half rhombic” which is apparently what it is, which use a ground wire of the straight line length and also suspend it above ground. Clearly this one is different as implied by the lack of differentiation of the two elements in the parts list in the service manual.

I have now got the transformer – how does the aerial wire attach to the insulator? I can see the hole where it goes – is something supposed to move to clamp the wire in place?

I can’t see a user manual for this kit in the VMARS list – is it part of the 353 manual as the ground spike and EVHF are in the 351 user manual?

Thanks for that (I think the first reference should be 3965 not 56).

Looks like what I thought was a cable clamp is just a socket for something like a 2mm banana plug on the aerial wire. (I only have the transformer unit).

By the time the good spring weather comes around I should have acquired or made up the other bits.

Niall

Hi Niall, the Emers you need are in the VMARS Archive Clansman Section, the document numbers are - 3956 - 3966 - 3967 - 3968 - 3969 - 3970, the Technical Handbook is 3966, gives all the info you should need.

1624. 6m nets IP14 - JO02 region

Yahoo group: Clansman351
Date: 2017-07-12 07:34:01 UTC
From: ajctrees@...
Topic: 1624 Message: 1624

Due to a lot of comments nationally that there is "no activity on the bands" I have been running
6m nets on a Monday evening. The "Mil kit net" is on 51.700 at 19.45hrs and runs up to the hour where we switch to the local 6m repeater GB3EF, to encourage use there. What I should also like to encourage is stations in other regions to start a similar activation, maybe even at the same time, enhancing the chances of overlap thus ability to extend our range. It goes without saying that the better the antenna system, the better your chances of getting further. I have found the military "pineapple" very restrictive in range, preferring EFHW antennas at height to get a signal out there. Anyway, I look forward to any stations calling in.
2e0DIQ Andy.

How so? Sorry but it's within the bands fm allocation, it does not interfere with other users, it is an accepted VMARS frequency which many are familiar with, (and we are operating military radios with 25khz spacings, rather than 20khz 50mhz amateur spacings.) and as a secondary user the frequencies are available provided non-interference with other users. Nothing says in my licence that I cannot operate on 51.700 fm. 2e0DIQ Andy.

I see nothing in your link or the detailed band plan at https://www.thersgb.org/services/bandplans/files/assets/basic-html/page-17.html# to suggest that it is anything other than a perfectly logical frequency to use.

It just my assumption made upon a logical thinking of if there's any FM simplex activity on 6m then the 1st choice would be an proposed channelised part with the calling frequency on it. Have a few different ex military transceivers what can go anywhere within 6m but a majority of them share same thing - very limited channel banks, be it 2, 6 or 12 and this allows scanning, priority etc "advanced" features but channel frequencies are not field programmable thus I stay with (i must say a bit funny) 6m channels band plan. When running one of them radios I'd usually keep the scanning mode on so it would go through a calling channel plus one of "clansman compatible" frequency and then channel capacity permits - rest of the channelised part. Not a "band police" by any means.

My initial idea was to go with 51.625 or 51.725, all fine and dandy and the rsgb "approved" frequencies for ex-mil kit. As I say all fine and dandy until I realised older kit that I have (ex-Warsaw Pact) is 50khz spacing. Thus throwing the cat firmly into the pigeons. As I wish to talk simplex to like minded souls on my nets, those with similar kit, it would be useless to consider the "regular" frequencies. So to make it as broad a field as possible, I looked to see where Vmars operates, and yes 51.700 is the frequency. My local club nets are on 51.430, to me utterly minimising user activity, the whole point of my nets is to encourage and welcome as many as possible in so they can use their ex-mil kit at least once a week. All the best 2e0DIQ Andy

Ok got the idea. None of my ex military is like 50kHz and rather "free tune" with 25kHz bandwidth per standard or narrow band. Here we would usually stick with 51.450 (should be ok with 50kHz too?) purely for Clansman rigs (a couple of 350 and 351 around). Similar story with 4m where we used to stick around 70.2625 but once started with Clansmans we had to change the frequency to 70.425 since 70.450 is not available (arguably) in Ireland for the moment. So you say 51.700 can by busy?

From ex Warsaw Pact one of our guys owns a Czech RF-10, not sure whether is 25 or 50kHz spacing but I was amazed how nicely it preformed. I own ex Polish Army T-2 manpack rig, although "demilitarised" by brute force drill-through. Hope to get it restored as by the looks and capabilities is loosely comparable to Racal Yeoman.

VMARS only use this frequency (51.700)on a very occasional basis and usually restricted to events where a lot of military vehicles turn up, about once a year perhaps, so you won't hear much! Any use of that frequency would be welcome I guess. At the Recent Capel Military Show 51.600 was used. I sit on 70.450 here in the Guildford area! There is a lively net on 70.325 in the Portsmouth area on Sunday mornings at 0900! With a little height it can be heard over 40 moles from Pompey!

Would I therefore be right in assuming 51.700 and 70.450 as working/calling frequencies for the upcoming War & Peace and Military Odyssey shows? I'll be at both, but not every day for W&P.

And also presumably 3.615AM for HF?

From: ajctrees@...
Topic: 1624 Message: 1637

TBH, I really don't care nor wish to debate where is or is by where others wish to sit and call one another. I run a net for people to participate in my area. If a frequency is announced, then people do not have an issue finding the activity. If people wish to run a net on their area, then they can choose where they wish to be. I've successfully run nets on various modes and bands without such a fuss being made.
As for 4m (70mhz) it's always been my band of preference over all other, but there is so much activity there anyway. 6m (50mhz) is unused for the most part, and tbh I can see why, it's noisier, varies in reliability even for local comms. However, I want to encourage users of military radios that only have 6m capability. This means I then I have at least one person to chat to on my 350, rf10 or p-148. I find it frustrating that people will complain that there is no activity, yet when you create activity, they still manage to complain. Never mind, the nets still running on 51.700 and still gets local users operating, that was my quest. 73 2e0DIQ Andy .

1638. 5080 tank set

Hello Jim
To remove the 150 Hz tone completely, remove R108 (the preset you turned down).
Turning the tone down still left it present at about 150 Hz deviation,
D.

Hello Jim

To remove the 150 Hz tone completely, remove R108 (the preset you turned down).

Turning the tone down still left it present at about 150 Hz deviation,

D.

It’s quite easy to make a remote box, see attached picture.

There is a standard diecast project box which is the right depth. Mine came from a junk sale without the lid so the lid is cut from thick aluminium sheet but the proper lid would be fine. The mounting holes are tapped to suit the control panel screws. The connector is a bit of PCB with the copper hacksawed into three sections, mounted on a couple of layers of foam tape to give the necessary contact pressure. A couple of standard equipment handles and a coat of Clansman Green complete it.
The hardest bit was finding a 7 pin Clansman chassis socket , they seem to be like rocking horse poo. You might need to buy a scrap pressel or audio extension to get one, or you could just hard wire to a cable and handset plug which is easier to get.

Because I only have one VRM5080 I didn’t fit two sockets and the switch which the proper unit has. Easy enough to do, the diagram is in the service manual which is available from VMARS.

The ATU connector is compatible with the Clansman TUAAM if that’s easier to get.

It was difficult for me to get one of these. I now have 2 of them. They are a beautiful piece and "built like a tank"! I would love to have the remote control head kit and antenna. It would make for a really awesome install in my truck. It was definitely worth finding someone that would eventually ship to me.CheersDenisVE3ZXN

Should have mentioned, the “blobs” which can be seen on the bottom of the box are just JB Weld where I filled in unwanted holes in the reused case. Even quite big holes in used diecast boxes can be filled this way, if you tape over the outside of the hole with insulating tape and fill with JB Weld from the inside the finish is perfectly smooth when the tape is peeled off after the JB Weld has set, no filing required and the repair is invisible under paint.

Hey Niall,
Thanks for that bit. I hadn't thought about the possibility to make a kit. It is definitely not your typical dash mount radio! I have a centre console in my truck and actually thought of removing it and having the whole radio sit upright, then build a console around it as another option.☐ The reason I considered the remote screen bit is a couple of these sitting in the back of the vehicle would aid in traction for winter time!
Cheers

With only 3 wires it’s a lot easier than most remote head kits! As far as I know the remote audio terminals are Clansman compatible so an RPU would provide volume control, or an RCU for 2 sets with only an additional 2 or 4 wires.

Not just the sets, the large additional batteries required for safe use in winter to avoid flattening the vehicle battery would also aid traction

Hi,

I am looking for schematics for a Tekade FSE 38/58 german military Radio.

The tranmitting audio is too low and I will try adjust audio input if have it.

thanks, Joca PS7JN

1649. BC563 AMU mounting

Yahoo group: Clansman351
Date: 2018-02-03 12:26:18 UTC
From: asgv30@...
Topic: 1649 Message: 1649

OT I know but there are some VRM5080 owners on this list - I am mounting the BC563 AMU which came with my VRM5080 on a Clansman "candlestick" bracket.

The mounting bolts on the AMU match the holes on the mount; the top of the mount fits perfectly inside the AMU shell but won't go right in because the corners of the U bracket on the mount foul it. Even if it did go in which could be done with a small amount of filing on the U bracket, it would then bear on 3 cap screw heads on the base of the AMU. I assume the AMU is meant to bolt down against the outer shell.

Before I fabricate an interface plate, is there an existing part I could get to do this?

I know these are not part of the same system but there is clearly commonality.

Also I was surprised how little weld there is between the top ring and the U bracket on the "candlestick", is this normal? Not critical as I don't intend to use the setup mobile.

Hi Niall, as far as I know there is no adapter plate, the 5080 sets available from a certain Ebay seller came from the Austrian Military, the AMU bolted directly onto the hull or turret of the vehicle, they did not use the Clansman kit AFAIK, so there would not be an adapter to/from Clansman, the 5080 can also use the TUAAM atu for the 353, just does not need the little interface box used with the 351/2 or 353 sets. Hi Leighton,

I just thought it was odd that the top of the candlestick is a perfect fit inside the AMU skirt and the mounting holes match. Some sort of compatibility must have been intended. I will cut an adapter plate.

I thought the 5080 should drive a TUAAM, didn’t consider if it would need an ARFAT. Presumably the reverse is true and a 351/2 and Initiate Box should drive the BC 563? (I don’t have a 353, bought the 5080 instead. Do have a couple of ARFATs from a job lot of misc. Clansman boxes.)

Hi Niall, the 5080 will drive the TUAAM direct, it does not need the ARFAT, I have not tried using my 351/2 with the 5080 ATU, I use the 353 antennae kit. You can of course use any tuned length VHF antennae with the 5080 through a manual VHF ATU which I do here with a little MFJ 906 ATU, it will in fact tune my 40M inverted V quite happily, (it has 32ft legs) and gets out quite well on 4M and 6M as does the 353, somewhere I have an article on removing the 150Hz tone from the 5080, Might (!) be in the files section.

Hi Leighton,

The mod to remove the tone was described in the earlier 5080 thread on this list. I've left mine, communication radios shouldn't reproduce it anyway , and I want to play with a 2 x 351 rebro setup if I can figure out the legalities.

I have the matching transformer and termination resistor for the Clansman VHF half rhombic, I hope to make up the cables and try it out with one of my roach poles this summer.

I have completed an adaptor to mount a Clansman candlestick on the detachable front towball I have for my pickup, and the adaptor BC563 – candlestick, it will be interesting to compare it with the half rhombic and the tunable sleeve dipole I built for 6m –70cm.

Hi Niall, I think you will find some folk will hear the tone, I had a couple of locals around south Wales tell me they could hear it in the background when I stopped talking, so I removed it on the 353 which I was using at the time and when I got the 5080 kit I did the same, no further comments received about the 5080 but the 353 psu has a very low level 'burble' which sounds just like the tone, nowt I can do about that, have fun. Leighton. GW3FSP.

It has arrived.

It physically fits in a 1Ah metal battery case but the clip fittings on the battery are where you would want to cut a hole to access the mains connector. No such problem with a 4Ah case but lots of wasted space. If I make the lid openable that space could be used to store the mains lead- or I might just fit a Clansman battery connector and use it as is.

Looks like a generic laptop PSU but at 24v instead of typically 19v. I've found these PSUs can be altered down to 13.8v by changing one resistor in the divider chain. No reason why they can't be altered up to 24v I shouldn't think as long as you can deal with SMD resistors.

This year I have set up to operate my 351, Racal tra967, prc77 vrm5080 etc through Echolink. It makes great use of these radios, it extends the use of the radios rather than limiting you to very localised and very sparse activity. For the radio purists out there, (I know, there are some) there is no modification to any of the military radios necessary. You can sit in your garden, your shack, where you like, and use your radios to talk to anyone in the world you like. I've also started an Echolink Military Radio Net for those interested. The net is open to all, utilising preferably our military radios but whatever means possible. Of course UK foundation level licences cannot operate a link or a gateway, they are restricted to phone/tablet/pc operation, but please feel welcome to join in. So if you wish to hear real military radios used, or wish to participate the net, it is every other Monday, the next being 20/08/18 20.00BST on 2e0DIQ-L, node number is 948105. Personally I feel that we are utilising the best of both military and amateur worlds, the military radios and the amateur technology of Echolink, an internet "re-bro" system if you like in accordance with our licence. Look forward to speaking to you,
73 de 2e0DIQ Andy
